

# Package ‘ciu’

August 2, 2025

**Type** Package

**Title** Contextual Importance and Utility

**Version** 0.8

**Date** 2025-06-04

**Maintainer** Kary Främling <Kary.Framling@umu.se>

**Description** Implementation of the Contextual Importance and Utility (CIU) concepts for Explainable AI (XAI). A description of CIU can be found in e.g. Främling (2020) <[doi:10.1007/978-3-030-51924-7\\_4](https://doi.org/10.1007/978-3-030-51924-7_4)>.

**License** MIT + file LICENSE

**Encoding** UTF-8

**Imports** graphics, stats, Rcpp, grDevices, crayon, ggplot2, ggbeeswarm

**Suggests** MASS, caret, gbm

**RoxygenNote** 7.3.2

**NeedsCompilation** no

**Author** Kary Främling [aut, cre]

**Repository** CRAN

**Date/Publication** 2025-06-16 17:20:02 UTC

ciu-package	<i>ciu: Contextual Importance and Utility</i>
-------------	---

---

## Description

Implementation of the Contextual Importance and Utility (CIU) concepts for Explainable AI (XAI). A description of CIU can be found in e.g. Främling (2020) [doi:10.1007/9783030519247\\_4](https://doi.org/10.1007/9783030519247_4).

## Details

This package implements the Contextual Importance and Utility (CIU) concepts for Explainable AI (XAI). CIU allows explaining output values of any regression or classification systems, no matter if it is a "black-box" or a "white-box" AI, or anything between black and white. CIU is entirely model-agnostic. Contrary to most (all?) other XAI methods, CIU provides explanations directly based on the observed input-output behavior without building an intermediate "interpretable" model for doing it.

CIU was developed by Kary Främling in his PhD thesis, which was presented in 1996 (in French). CIU was first presented in 1995 at the International Conference on Artificial Neural Networks (ICANN).

The `ciu` package supports models from `caret` and at least `lda` natively, but can easily be made to work with any model.

### Main functions:

Use of `ciu` starts by calling the function `ciu.new` that returns an object of class `CIU`. If the `CIU` object is created by `ciu <- ciu.new(...)`, then different methods can be called as `ciu$explain()`, `ciu$barplot.ciu()` etc. for obtaining explanations in different forms.

`ciu` is implemented using an "old style" (?) R object orientation. However, it provides object-oriented encapsulation of variables and methods of the `CIU` object, which presumably helps to avoid name conflicts with other packages or user code.

Since version 0.5.0 it is also possible to use a non-object-oriented approach by creating an ordinary [list](#) of class `ciu` by calling the function `ciu`. That `ciu` object is then passed as the first parameter to the different functions. This parallel possibility was originally developed mainly for getting support

for proper Roxygen functionality. However, it does also offer some interesting properties, e.g. a CIU object takes up much more memory than a ciu object because it creates its own environment. CIU objects can be converted to ciu objects and vice versa at any time by the `<CIU>$as.ciu()` method and the `ciu.to.CIU` function.

It is recommended to use the object-oriented approach in order to avoid unnecessary conversions back and forth. However, the difference is presumably not very significant.

---

ciu	<i>Create ciu object.</i>
-----	---------------------------

---

### Description

Sets up a ciu object with the given parameters. This is not the same as a CIU object as returned by the function `ciu.new!` a ciu object is a `list` with all the parameter values needed for Contextual Importance and Utility calculations, whereas a CIU object only exposes a set of methods that can be called using the `$` operator. CIU provides the method `$as.ciu` for retrieving a ciu object from a CIU object.

### Usage

```
ciu(  
  model,  
  formula = NULL,  
  data = NULL,  
  in.min.max.limits = NULL,  
  abs.min.max = NULL,  
  input.names = NULL,  
  output.names = NULL,  
  predict.function = NULL,  
  vocabulary = NULL  
)
```

### Arguments

model	Model/"black-box" object (same parameter as <code>bb</code> for function <code>ciu.new</code> ).
formula	Formula that describes input versus output values. Only to be used together with <code>data</code> parameter.

<code>data</code>	The training data used for training the model. If this parameter is provided, a formula <b>MUST</b> be given also. <code>ciu.new</code> attempts to infer the other parameters from data and formula. i.e. <code>in.min.max.limits</code> , <code>abs.min.max</code> , <code>input.names</code> and <code>output.names</code> . If those parameters are provided, then they override the inferred ones.
<code>in.min.max.limits</code>	matrix with one row per output and two columns, where the first column indicates the minimal value and the second column the maximal value for that input.
<code>abs.min.max</code>	<a href="#">data.frame</a> or <a href="#">matrix</a> of min-max values of outputs, one row per output, two columns (min, max).
<code>input.names</code>	labels of inputs.
<code>output.names</code>	labels of outputs.
<code>predict.function</code>	can be supplied if a model that is not supported by <code>ciu</code> should be used. As an example, this is the function for <code>lda</code> : <pre>o.predict.function &lt;- function(model, inputs) {   pred &lt;- predict(model, inputs)   return(pred\$posterior) }</pre>
<code>vocabulary</code>	list of labels/concepts to be used when producing explanations and what combination of inputs they correspond to. Example of two intermediate concepts and a higher-level one that combines them: <code>list(intermediate.concept1=c(1,2,3), intermediate.concept2=c(4,5), higher.level.concept=c(1,2,3,4,5))</code>

**Value**

`ciu` object.

**Author(s)**

Kary Främling

**See Also**

[ciu.new](#)

**Examples**

```
# Explaining the classification of an Iris instance with lda model.
# We use a versicolor (instance 100).
library(MASS)
test.ind <- 100
iris_test <- iris[test.ind, 1:4]
iris_train <- iris[-test.ind, 1:4]
iris_lab <- iris[[5]][-test.ind]
model <- lda(iris_train, iris_lab)
```

```
# Create CIU object
ciu <- ciu(model, Species~., iris)

# This can be used with explain method for getting CIU values
# of one or several inputs. Here we get CIU for all three outputs
# with input feature "Petal.Length" that happens to be the most important.
ciu.explain(ciu, iris_test, 1)

# It is, however, more convenient to use one of the graphical visualizations.
# Here's one using ggplot.
ciu.ggplot.col(ciu, iris_test)
```

---

ciu.barplot

*ciu.barplot*

---

## Description

Create a barplot showing CI as the length of the bar and CU on color scale from red to green, via yellow, for the given inputs and the given output.

## Usage

```
ciu.barplot(
  ciu,
  instance,
  ind.inputs = NULL,
  ind.output = 1,
  in.min.max.limits = NULL,
  n.samples = 100,
  neutral.CU = 0.5,
  show.input.values = TRUE,
  concepts.to.explain = NULL,
  target.concept = NULL,
  target.ciu = NULL,
  ciu.meta = NULL,
  color.ramp.below.neutral = NULL,
  color.ramp.above.neutral = NULL,
  use.influence = FALSE,
  sort = NULL,
  decreasing = FALSE,
  main = NULL,
  xlab = NULL,
  xlim = NULL,
  ...
)
```

**Arguments**

<code>ciu</code>	ciu object as created with <code>ciu</code> function (not to be confused with CIU object as created by <code>ciu.new</code> ).
<code>instance</code>	Input values for the instance to explain. Should be a <code>data.frame</code> even though a vector or matrix might work too if input names and other needed metadata can be deduced from the dataset or other parameters given to <code>ciu.new</code> .
<code>ind.inputs</code>	Vector of indices for the inputs to be included in the plot. If NULL then all inputs will be included.
<code>ind.output</code>	Index of output to be explained.
<code>in.min.max.limits</code>	<code>data.frame</code> or <code>matrix</code> with one row per output and two columns, where the first column indicates the minimal value and the second column the maximal value for that output. ONLY NEEDED HERE IF not given as parameter to <code>ciu.new</code> or if the limits are different for this specific instance than the default ones.
<code>n.samples</code>	How many instances to generate for estimating CI and CU. For inputs of type <code>factor</code> , all possible combinations of input values are generated, so this parameter only influences how many instances are (at least) generated for continuous-valued inputs.
<code>neutral.CU</code>	Indicates when the Contextual Utility is considered to be "negative". The default value of 0.5 seems quite logical for most cases.
<code>show.input.values</code>	Include input values after input labels or not. Default is TRUE.
<code>concepts.to.explain</code>	List of concepts to use in the plot, as defined by vocabulary provided as argument to <code>ciu.new</code> . If <code>ind.inputs=NULL</code> , then use <code>concepts.to.explain</code> instead. If both are NULL, then use all inputs.
<code>target.concept</code>	If provided, then calculate CIU of inputs <code>ind.inputs.to.explain</code> relative to the given concept rather than relative to the actual output(s). <code>ind.inputs.to.explain</code> should normally be a subset (or all) of the inputs that <code>target.concept</code> consists of, even though that not required by the CIU calculation. If a <code>target.ciu</code> is provided, then the <code>target.concept</code> doesn't have to be included in the vocabulary gives as parameter to <code>ciu.new</code> (at least for the moment).
<code>target.ciu</code>	<code>ciu.result</code> object previously calculated for <code>target.concept</code> . If a <code>target.concept</code> is provided but <code>target.ciu=NULL</code> , then <code>target.ciu</code> is estimated by a call to <code>ciu.explain</code> with the <code>n.samples</code> value given as a parameter to this call. It may be useful to provide <code>target.ciu</code> if it should be estimated using some other (typically greater) value for <code>n.samples</code> than the default one, or if it has already been calculated for some reason.
<code>ciu.meta</code>	If given, then use existing <code>ciu.meta.result</code> rather than calling <code>ciu.meta.explain</code> .
<code>color.ramp.below.neutral</code>	Color ramp function as returned by function <code>colorRamp()</code> . Default color ramp is from red3 to yellow.
<code>color.ramp.above.neutral</code>	Color ramp function as returned by function <code>colorRamp()</code> . Default colorramp is from yellow to darkgreen.

use.influence	Plot using "influence" rather than CIU, i.e. a LIME-like barplot. Default is FALSE.
sort	NULL, "CI" or "CU".
decreasing	Set to TRUE for decreasing sort.
main	Text to use as main title.
xlab	Label for x-axis.
xlim	Minimal and maximal values for x-axis.
...	See <a href="#">base::plot</a> .

**Value**

"void", i.e. whatever happens to be result of last instruction.

[ciu.new](#)

[ciu.explain](#)

---

ciu.blackbox.new	<i>Create CIU.BlackBox object</i>
------------------	-----------------------------------

---

**Description**

This method mainly serves as an "interface specification" for objects of class `CIU.BlackBox`, i.e. it defines what method(s) have to be implemented by any object of class `CIU.BlackBox`. A `CIU.BlackBox` object is actually a [list](#).

**Usage**

```
ciu.blackbox.new()
```

**Details**

An alternative and simpler (but less flexible) way to do the same is to use the `predict.function` parameter of [ciu.new](#), where `predict.function <- function(model, inputs) {predict(model, inputs, n.trees=10000)}` would accomplish the same as for the Example below. An example using this approach is also included in Examples.

The advantage of using a `CIU.BlackBox` wrapper (rather than the simple `predict.function` approach) is that it is possible to keep object variables or maintain whatever state information might be needed between calls.

The only things that are actually required from a `CIU.BlackBox` object is:

1. That it is a `list` with an element called `eval`.
2. That the value of `eval` element is a function of the form `eval = function(inputs)`
3. That it inherits the class `CIU.BlackBox`.

### Value

Object of class `CIU.BlackBox`.

### Author(s)

Kary Främling

### Examples

```
# Create CIU.BlackBox wrapper for Gradient Boosting
library(MASS) # Just in case Boston is not already available
library(gbm)
gbm.ciu.bb <- function(gbm, n.trees=1) {
  o.gbm <- gbm
  o.n.trees <- n.trees
  pub <- list(eval = function(inputs) { predict(o.gbm,inputs,n.trees=o.n.trees) })
  class(pub) <- c("CIU.BlackBox",class(pub))
  return(pub)
}

# Train and explain. We don't care about training/test sets here.
gbm.Boston <- gbm(medv ~ . ,data = Boston, distribution = "gaussian",
n.trees=10000, shrinkage = 0.01, interaction.depth = 4)
gbm.ciu <- gbm.ciu.bb(gbm.Boston, 10000)
ciu <- ciu.new(gbm.ciu, medv~., Boston)
ciu$barplot.ciu(Boston[370,1:13], sort = "CI")

# Same but using `predict.function` parameter in `ciu.new`.
# Using `ggplot.col.ciu` here for a change.
predict.function <- function(model, inputs) {predict(model,inputs,n.trees=10000)}
ciu <- ciu.new(gbm.Boston, medv~., Boston, predict.function=predict.function)
ciu$ggplot.col.ciu(Boston[370,1:13], sort = "CI")
```

---

ciu.contextual.influence

*Get Contextual influence values*

---

### Description

Contextual influence is calculated from CI and CU values, using a baseline that is considered a "neutral" CU value.

**Usage**

```
ciu.contextual.influence(  
  ciu.result = NULL,  
  CI = NULL,  
  CU = NULL,  
  neutral.CU = 0.5  
)
```

**Arguments**

ciu.result	<a href="#">data.frame</a> with CI and CU columns. If NULL, then CI and CU values must be provided.
CI	CI value(s).
CU	CU value(s).
neutral.CU	Neutral CU value(s). Default is 0.5

**Value**

Contextual influence value(s). Value or vector.

**Author(s)**

Kary Främling

---

ciu.contrastive      *Create a contrastive explanation between two instances*

---

**Description**

Create a contrastive explanation between two instances

**Usage**

```
ciu.contrastive(ciu.result1, ciu.result2)
```

**Arguments**

ciu.result1	First instance as ciu.result object.
ciu.result2	Second instance as ciu.result object.

**Value**

Contrastive influence values, where CU values of second instance are used as baseline for first instance.

**Author(s)**

Kary Främling

**Examples**

```

library(ciu)
library(MASS)
test.ind <- 100
iris_test <- iris[test.ind, 1:4]
iris_train <- iris[-test.ind, 1:4]
iris_lab <- iris[[5]][-test.ind]
model <- lda(iris_train, iris_lab)
# Create CIU object
ciu <- ciu.new(model, Species~., iris)
# First case: why is this a versicolor and not a virginica?
meta <- ciu$meta.explain(iris_test)
ciuvals.versicolor <- ciu.list.to.frame(meta$ciuvals, out.ind = 2)
ciuvals.virginica <- ciu.list.to.frame(meta$ciuvals, out.ind = 3)
# Now the contrastive part:
why.versicolor.not.virginica <- ciu.contrastive(ciuvals.versicolor, ciuvals.virginica)

```

---

ciu.explain

*Calculate CIU for specific instance*

---

**Description**

Calculate Contextual Importance (CI) and Contextual Utility (CU) for an instance (Context) using the given "black-box" model.

**Usage**

```

ciu.explain(
  ciu,
  instance,
  ind.inputs.to.explain,
  in.min.max.limits = NULL,
  n.samples = 100,
  target.concept = NULL,
  target.ciu = NULL
)

```

**Arguments**

ciu	ciu object as created with <a href="#">ciu</a> function (not to be confused with CIU object as created by <a href="#">ciu.new</a> ).
instance	Input values for the instance to explain. Should be a <a href="#">data.frame</a> even though a vector or matrix might work too if input names and other needed metadata can be deduced from the dataset or other parameters given to <a href="#">ciu.new</a> .

ind.inputs.to.explain	<a href="#">vector</a> of indices for the inputs to be explained, i.e. for which CIU should be calculated. If NULL, then all inputs will be included.
in.min.max.limits	<a href="#">data.frame</a> or <a href="#">matrix</a> with one row per output and two columns, where the first column indicates the minimal value and the second column the maximal value for that output. ONLY NEEDED HERE IF not given as parameter to <a href="#">ciu.new</a> or if the limits are different for this specific instance than the default ones.
n.samples	How many instances to generate for estimating CI and CU. For inputs of type <a href="#">factor</a> , all possible combinations of input values are generated, so this parameter only influences how many instances are (at least) generated for continuous-valued inputs.
target.concept	If provided, then calculate CIU of inputs <code>ind.inputs.to.explain</code> relative to the given concept rather than relative to the actual output(s). <code>ind.inputs.to.explain</code> should normally be a subset (or all) of the inputs that <code>target.concept</code> consists of, even though that not required by the CIU calculation. If a <code>target.ciu</code> is provided, then the <code>target.concept</code> doesn't have to be included in the vocabulary gives as parameter to <a href="#">ciu.new</a> (at least for the moment).
target.ciu	<a href="#">ciu.result</a> object previously calculated for <code>target.concept</code> . If a <code>target.concept</code> is provided but <code>target.ciu=NULL</code> , then <code>target.ciu</code> is estimated by a call to <a href="#">ciu.explain</a> with the <code>n.samples</code> value given as a parameter to this call. It may be useful to provide <code>target.ciu</code> if it should be estimated using some other (typically greater) value for <code>n.samples</code> than the default one, or if it has already been calculated for some reason.

**Value**

`ciu.result` object.

**Author(s)**

Kary Främling

---

`ciu.explain.long.data.frame`

*Produce CIU explanations as "long" [data.frame](#)*

---

**Description**

This function takes a CIU object and calculates CIU values for the whole data set given as parameter to [ciu.new](#) or given as the data parameter.

**Usage**

```
ciu.explain.long.data.frame(CIU, data = NULL, out.ind = 1, neutral.CU = 0.5)
```

**Arguments**

CIU	CIU object, as created by <code>ciu.new</code> .
data	Data to use as <code>data.frame</code> (default: <code>NULL</code> ). If <code>NULL</code> , then use the data of the CIU object, if that exists. This <code>data.frame</code> must contain only feature (input) values, not output value(s).
out.ind	Index of output to explain. Default: 1.
neutral.CU	Neutral CU value(s). Default is 0.5.

**Value**

`data.frame` of class "ciu.result.long.data.frame".

**Examples**

```
## Not run:
# Boston data set with GBM model.
library(MASS)
library(caret)
kfoldcv <- trainControl(method="cv", number=10)
gbm <- caret::train(medv ~ ., Boston, method="gbm", trControl=kfoldcv)
ciu <- ciu.new(gbm, medv~., Boston)
df <- ciu.explain.long.data.frame(ciu)
head(df)
# Only get results for a part of the data set.
ciu.explain.long.data.frame(ciu, data=subset(Boston[1:10,], select=-medv))

## End(Not run)
```

---

ciu.ggplot

*ciu.ggplot*

---

**Description**

Function for plotting out the effect of changing values of one input on one output.

**Usage**

```
ciu.ggplot(
  ciu,
  instance,
  ind.input = 1,
  ind.output = 1,
  in.min.max.limits = NULL,
  n.points = 40,
  main = NULL,
  xlab = NULL,
  ylab = NULL,
```

```

ylim = NULL,
illustrate.CIU = FALSE,
neutral.CU = 0.5,
CIU.illustration.colours = c("red", "orange", "green", "blue"),
categorical_style = "segment"
)

```

## Arguments

ciu	ciu object as created with <code>ciu</code> function (not to be confused with CIU object as created by <code>ciu.new</code> ).
instance	Input values for the instance to explain. Should be a <code>data.frame</code> even though a vector or <code>matrix</code> might work too if input names and other needed metadata can be deduced from the dataset or other parameters given to <code>ciu.new</code> .
ind.input	Index of input feature to plot.
ind.output	Index of output to plot.
in.min.max.limits	<code>data.frame</code> or <code>matrix</code> with one row per output and two columns, where the first column indicates the minimal value and the second column the maximal value for that output. ONLY NEEDED HERE IF not given as parameter to <code>ciu.new</code> or if the limits are different for this specific instance than the default ones.
n.points	How many x,y pairs will be calculated, equally spaced over <code>in.min.max.limits</code> .
main	Text to use as main title.
xlab	Label for x-axis.
ylab	Label for y-axis.
ylim	Minimal and maximal values for y-axis.
illustrate.CIU	Include illustration of CIU Cmin, Cmax, neutral.CU. Default is FALSE
neutral.CU	Value of neutral.CU. Default is 0.5.
CIU.illustration.colours	Colours to use for illustrating CIU. Default is red, orange, green.
categorical_style	Use line segments or histogram plot for categorical features. Possible values are "segment" or "hist".

## Value

ggplot object.

## Author(s)

Kary Främling

---

 ciu.ggplot.col

*CIU feature importance/utility plot using ggplot.*

---

### Description

Create a barplot showing CI as the length of the bar and CU on color scale from red to green, via yellow, for the given inputs and the given output.

### Usage

```
ciu.ggplot.col(
  ciu,
  instance = NULL,
  ind.inputs = NULL,
  output.names = NULL,
  in.min.max.limits = NULL,
  n.samples = 100,
  neutral.CU = 0.5,
  show.input.values = TRUE,
  concepts.to.explain = NULL,
  target.concept = NULL,
  target.ciu = NULL,
  ciu.meta = NULL,
  plot.mode = "colour_cu",
  ci.colours = c("aquamarine", "aquamarine3", "0.3"),
  cu.colours = c("darkgreen", "darkgreen", "0.8"),
  low.color = "red",
  mid.color = "yellow",
  high.color = "darkgreen",
  use.influence = FALSE,
  scale.CI = FALSE,
  sort = NULL,
  decreasing = FALSE,
  main = NULL
)
```

### Arguments

ciu	ciu object as created with <a href="#">ciu</a> function (not to be confused with CIU object as created by <a href="#">ciu.new</a> ).
instance	Input values for the instance to explain. Should be a <a href="#">data.frame</a> even though a vector or matrix might work too if input names and other needed metadata can be deduced from the dataset or other parameters given to <a href="#">ciu.new</a> .
ind.inputs	Indices of input features to explain (the set {i} in CIU formulae)
output.names	Vector with names of outputs to include. If NULL (default), then include all.

<code>in.min.max.limits</code>	<code>data.frame</code> or <code>matrix</code> with one row per output and two columns, where the first column indicates the minimal value and the second column the maximal value for that output. ONLY NEEDED HERE IF not given as parameter to <code>ciu.new</code> or if the limits are different for this specific instance than the default ones.
<code>n.samples</code>	How many instances to generate for estimating CI and CU. For inputs of type <code>factor</code> , all possible combinations of input values are generated, so this parameter only influences how many instances are (at least) generated for continuous-valued inputs.
<code>neutral.CU</code>	Indicates when the Contextual Utility is considered to be "negative". The default value of 0.5 seems quite logical for most cases.
<code>show.input.values</code>	Include input values after input labels or not. Default is TRUE.
<code>concepts.to.explain</code>	List of input feature concepts to explain, as defined by vocabulary provided as argument to <code>ciu.new</code> . If <code>ind.inputs=NULL</code> , then use <code>concepts.to.explain</code> instead. If both are NULL, then use all inputs.
<code>target.concept</code>	If provided, then calculate CIU of inputs <code>ind.inputs.to.explain</code> relative to the given concept rather than relative to the actual output(s). <code>ind.inputs.to.explain</code> should normally be a subset (or all) of the inputs that <code>target.concept</code> consists of, even though that not required by the CIU calculation. If a <code>target.ciu</code> is provided, then the <code>target.concept</code> doesn't have to be included in the vocabulary gives as parameter to <code>ciu.new</code> (at least for the moment).
<code>target.ciu</code>	<code>ciu.result</code> object previously calculated for <code>target.concept</code> . If a <code>target.concept</code> is provided but <code>target.ciu=NULL</code> , then <code>target.ciu</code> is estimated by a call to <code>ciu.explain</code> with the <code>n.samples</code> value given as a parameter to this call. It may be useful to provide <code>target.ciu</code> if it should be estimated using some other (typically greater) value for <code>n.samples</code> than the default one, or if it has already been calculated for some reason.
<code>ciu.meta</code>	If given, then use existing <code>ciu.meta.result</code> rather than calling <code>ciu.meta.explain</code> .
<code>plot.mode</code>	"overlap" or "colour_cu". Default is "colour_cu".
<code>ci.colours</code>	Colours to use for CI part in "overlap" mode. Three values required: fill colour, border colour, alpha. Default is <code>c("aquamarine", "aquamarine3", "0.3")</code> .
<code>cu.colours</code>	Colours to use for CU part in "overlap" mode. Three values required: fill colour, border colour, alpha. Default is <code>c("darkgreen", "darkgreen", "0.8")</code> . If it is set to NULL, then the same colour palette is used as for "colour_cu".
<code>low.color</code>	Colour to use for CU=0
<code>mid.color</code>	Colour to use for CU=Neutral.CU
<code>high.color</code>	Colour to use for CU=1
<code>use.influence</code>	Plot using "influence" rather than CIU, i.e. a LIME-like barplot. Default is FALSE.
<code>scale.CI</code>	Scale x-axis according to maximal CI value.
<code>sort</code>	NULL, "CI" or "CU".
<code>decreasing</code>	Set to TRUE for decreasing sort.
<code>main</code>	Text to use as main title.

**Value**

ggplot object.

**Author(s)**

Kary Främling

---

ciu.ggplot.contrastive

*Create contrastive ggplot*

---

**Description**

Create contrastive ggplot

**Usage**

```
ciu.ggplot.contrastive(  
  ciu.meta.result,  
  contrastive.influences,  
  instance.names = NULL,  
  question = "Why?",  
  negative.color = "firebrick",  
  positive.color = "steelblue"  
)
```

**Arguments**

<code>ciu.meta.result</code>	<code>ciu.meta.result</code> object for the instance to be explained, i.e. the first instance parameter of <code>ciu.contrastive</code> .
<code>contrastive.influences</code>	Contrastive influence values, as normally returned by <code>ciu.contrastive</code> .
<code>instance.names</code>	Vector with the labels to be used for the compared classes/instances. If <code>NULL</code> , then we use <code>c("instance One", "instance Two")</code> .
<code>question</code>	What kind of explanation do we answer. Can be "Why?" and "Why not?". Default is "Why?".
<code>negative.color</code>	Color to use for negative influence. Default is firebrick.
<code>positive.color</code>	Color to use for positive influence. Default is steelblue.

**Value**

ggplot object.

**Author(s)**

Kary Främling

## Examples

```
library(ciu)
library(MASS)
test.ind <- 100
iris_test <- iris[test.ind, 1:4]
iris_train <- iris[-test.ind, 1:4]
iris_lab <- iris[[5]][-test.ind]
model <- lda(iris_train, iris_lab)
# Create CIU object
ciu <- ciu.new(model, Species~., iris)
# First case: why is this a versicolor and not a virginica?
meta <- ciu$meta.explain(iris_test)
ciuvals.versicolor <- ciu.list.to.frame(meta$ciuvals, out.ind = 2)
ciuvals.virginica <- ciu.list.to.frame(meta$ciuvals, out.ind = 3)
# Now the contrastive part:
contrastive <- ciu.contrastive(ciuvals.versicolor, ciuvals.virginica)
print(ciu.ggplot.contrastive(meta, contrastive, c("Versicolor", "Virginica")))
# Then a "Why not?" explanation
contrastive.neg <- ciu.contrastive(ciuvals.virginica, ciuvals.versicolor)
print(ciu.ggplot.contrastive(meta, contrastive.neg,
  question = "Why not?", c("Virginica", "Versicolor")))
```

---

ciu.list.to.frame      *ciu.list.to.frame*

---

## Description

Convert [list](#) of [ciu.result](#) objects into corresponding [data.frame](#) for given output.

## Usage

```
ciu.list.to.frame(ciu.list, out.ind = 1)
```

## Arguments

`ciu.list`      [list](#) of [ciu.result](#) objects.  
`out.ind`      Index of output to extract.

## Value

[data.frame](#) with same columns as [ciu.result](#) object but with one row per input feature.

## Author(s)

Kary Främling

**Examples**

```
library(MASS)
iris_train <- iris[, 1:4]
iris_lab <- iris$Species
iris_lda <- lda(iris_train, iris_lab)
instance <- iris[100,1:4]
ciu <- ciu.new(iris_lda, Species~., iris)
meta <- ciu$meta.explain(instance)
ciu.list.to.frame(meta$ciuvals)
```

---

```
ciu.meta.explain      ciu.meta.explain
```

---

**Description**

ciu.meta.explain

**Usage**

```
ciu.meta.explain(
  ciu,
  instance,
  ind.inputs = NULL,
  in.min.max.limits = NULL,
  n.samples = 100,
  concepts.to.explain = NULL,
  target.concept = NULL,
  target.ciu = NULL
)
```

**Arguments**

ciu	ciu object as created with <code>ciu</code> function (not to be confused with CIU object as created by <code>ciu.new</code> ).
instance	Input values for the instance to explain. Should be a <code>data.frame</code> even though a vector or matrix might work too if input names and other needed metadata can be deduced from the dataset or other parameters given to <code>ciu.new</code> .
ind.inputs	Indices of input features to explain (the set {i} in CIU formulae)
in.min.max.limits	<code>data.frame</code> or <code>matrix</code> with one row per output and two columns, where the first column indicates the minimal value and the second column the maximal value for that output. <b>ONLY NEEDED HERE IF</b> not given as parameter to <code>ciu.new</code> or if the limits are different for this specific instance than the default ones.
n.samples	How many instances to generate for estimating CI and CU. For inputs of type <code>factor</code> , all possible combinations of input values are generated, so this parameter only influences how many instances are (at least) generated for continuous-valued inputs.

concepts.to.explain	List of input feature concepts to explain, as defined by vocabulary provided as argument to <a href="#">ciu.new</a> . If <code>ind.inputs=NULL</code> , then use <code>concepts.to.explain</code> instead. If both are <code>NULL</code> , then use all inputs.
target.concept	If provided, then calculate CIU of inputs <code>ind.inputs.to.explain</code> relative to the given concept rather than relative to the actual output(s). <code>ind.inputs.to.explain</code> should normally be a subset (or all) of the inputs that <code>target.concept</code> consists of, even though that not required by the CIU calculation. If a <code>target.ciu</code> is provided, then the <code>target.concept</code> doesn't have to be included in the vocabulary gives as parameter to <a href="#">ciu.new</a> (at least for the moment).
target.ciu	<code>ciu.result</code> object previously calculated for <code>target.concept</code> . If a <code>target.concept</code> is provided but <code>target.ciu=NULL</code> , then <code>target.ciu</code> is estimated by a call to <a href="#">ciu.explain</a> with the <code>n.samples</code> value given as a parameter to this call. It may be useful to provide <code>target.ciu</code> if it should be estimated using some other (typically greater) value for <code>n.samples</code> than the default one, or if it has already been calculated for some reason.

**Value**

An object of class `ciu.meta.result`.

**Author(s)**

Kary Främling

**Examples**

```
# Explaining the classification of an Iris instance with lda model.
# We use a versicolor (instance 100).
library(MASS)
test.ind <- 100
iris_test <- iris[test.ind, 1:4]
iris_train <- iris[-test.ind, 1:4]
iris_lab <- iris[[5]][-test.ind]
model <- lda(iris_train, iris_lab)

# Create CIU object
ciu <- ciu.new(model, Species~., iris)

# Get ciu.meta.result. This can either be 'ciu$meta.explain(...)'
# or 'ciu.meta.explain(ciu, ...)'
ciu.meta <- ciu$meta.explain(iris_test)

# Use same result for different visualisations.
ciu$ggplot.col.ciu(ciu.meta = ciu.meta)
ciu$barplot.ciu(ind.output = 2, ciu.meta = ciu.meta)
ciu$pie.ciu(ind.output = 2, ciu.meta = ciu.meta)

## Not run:
# Same with Boston Housing data set.
library(caret)
```

```

gbm <- train(medv ~ ., Boston, method="gbm", trControl=trainControl(method="cv", number=10))
ciu <- ciu.new(gbm, medv~., Boston)
instance <- Boston[370,1:13]
ciu.meta <- ciu$meta.explain(instance)
ciu$barplot.ciu(ciu.meta = ciu.meta, sort = "CI")
ciu$pie.ciu(ciu.meta = ciu.meta)
ciu$ggplot.col.ciu(ciu.meta = ciu.meta)

## End(Not run)

```

---

```
ciu.meta.result.new CIU meta-result object
```

---

## Description

Create object of class `ciu.meta.result`, which stores results of CIU calculations together with their "meta-data". The `ciu.meta.explain()` method returns a `ciu.meta.result` object.

## Usage

```

ciu.meta.result.new(
  ciu,
  instance,
  ciuvals,
  ind.inputs = NULL,
  inp.names = NULL,
  in.min.max.limits = NULL,
  n.samples = NULL,
  target.concept = NULL,
  target.ciu = NULL
)

```

## Arguments

<code>ciu</code>	ciu object as created with <code>ciu</code> function (not to be confused with CIU object as created by <code>ciu.new</code> ).
<code>instance</code>	Input values for the instance to explain. Should be a <a href="#">data.frame</a> even though a vector or matrix might work too if input names and other needed metadata can be deduced from the dataset or other parameters given to <code>ciu.new</code> .
<code>ciuvals</code>	List of <code>ciu.result</code> objects, one per input feature.
<code>ind.inputs</code>	Indices of input features to explain (the set $\{i\}$ in CIU formulae)
<code>inp.names</code>	Names of the input features.
<code>in.min.max.limits</code>	<a href="#">data.frame</a> or <a href="#">matrix</a> with one row per output and two columns, where the first column indicates the minimal value and the second column the maximal value for that output. ONLY NEEDED HERE IF not given as parameter to <code>ciu.new</code> or if the limits are different for this specific instance than the default ones.

n.samples	How many instances to generate for estimating CI and CU. For inputs of type <a href="#">factor</a> , all possible combinations of input values are generated, so this parameter only influences how many instances are (at least) generated for continuous-valued inputs.
target.concept	If provided, then calculate CIU of inputs <code>ind.inputs.to.explain</code> relative to the given concept rather than relative to the actual output(s). <code>ind.inputs.to.explain</code> should normally be a subset (or all) of the inputs that <code>target.concept</code> consists of, even though that not required by the CIU calculation. If a <code>target.ciu</code> is provided, then the <code>target.concept</code> doesn't have to be included in the vocabulary gives as parameter to <a href="#">ciu.new</a> (at least for the moment).
target.ciu	<code>ciu.result</code> object previously calculated for <code>target.concept</code> . If a <code>target.concept</code> is provided but <code>target.ciu=NULL</code> , then <code>target.ciu</code> is estimated by a call to <a href="#">ciu.explain</a> with the <code>n.samples</code> value given as a parameter to this call. It may be useful to provide <code>target.ciu</code> if it should be estimated using some other (typically greater) value for <code>n.samples</code> than the default one, or if it has already been calculated for some reason.

**Value**

An object of class `ciu.meta.result`, which is a [list](#) with same elements as the given parameters.

**Author(s)**

Kary Främling

---

ciu.new

*Create CIU object*

---

**Description**

Sets up a CIU object with the given parameters. CIU objects have "public" and "private" methods. A CIU object is actually a [list](#) whose elements are the public functions (methods).

**Usage**

```
ciu.new(
  bb,
  formula = NULL,
  data = NULL,
  in.min.max.limits = NULL,
  abs.min.max = NULL,
  input.names = NULL,
  output.names = NULL,
  predict.function = NULL,
  vocabulary = NULL
)
```

## Arguments

bb	Model/"black-box" object. At least all caret models, the lda model from MASS, and the lm model are supported. Otherwise, the prediction function to be used can be gives as value of the predict.function parameter. A more powerful way is to inherit from FunctionApproximator class and implement an "eval" method.
formula	Formula that describes input versus output values. Only to be used together with data parameter.
data	The training data used for training the model. If this parameter is provided, a formula MUST be given also. ciu.new attempts to infer the other parameters from data and formula. i.e. in.min.max.limits, abs.min.max, input.names and output.names. If those parameters are provided, then they override the inferred ones.
in.min.max.limits	matrix with one row per output and two columns, where the first column indicates the minimal value and the second column the maximal value for that input.
abs.min.max	<a href="#">data.frame</a> or <a href="#">matrix</a> of min-max values of outputs, one row per output, two columns (min, max).
input.names	labels of inputs.
output.names	labels of outputs.
predict.function	can be supplied if a model that is not supported by ciu should be used. As an example, this is the function for lda: <pre>o.predict.function &lt;- function(model, inputs) {   pred &lt;- predict(model,inputs)   return(pred\$posterior) }</pre>
vocabulary	list of labels/concepts to be used when producing explanations and what combination of inputs they correspond to. Example of two intermediate concepts and a higher-level one that combines them: <code>list(intermediate.concept1=c(1,2,3), intermediate.concept2=c(4,5), higher.level.concept=c(1,2,3,4,5))</code>

## Details

CIU is implemented in an object-oriented manner, where a CIU object is a [list](#) whose methods are made visible as elements of the list. The general way for using CIU objects is to first get a CIU object by calling [ciu.new](#) as e.g. `ciu <- ciu.new(...)`, then call `ciu.res <- ciu$<method>(...)`. The methods that can be used in `<method>` are:

- `explain`, see [ciu.explain](#) (but omit first parameter `ciu`)
- `meta.explain`, see [ciu.meta.explain](#) (but omit first parameter `ciu`).
- `barplot.ciu`, see [ciu.barplot](#) (but omit first parameter `ciu`)
- `ggplot.col.ciu`, see [ciu.ggplot.col](#) (but omit first parameter `ciu`)
- `pie.ciu`, see [ciu.pie](#) (but omit first parameter `ciu`)

- `plot.ciu`, see [ciu.plot](#) (but omit first parameter `ciu`)
- `plot.ciu.3D`, see [ciu.plot.3D](#) (but omit first parameter `ciu`)
- `textual`, see [ciu.textual](#) (but omit first parameter `ciu`).

*"Usage" section is here in "Details" section because Roxygen etc. don't support documentation of functions within functions.*

## Value

Object of class CIU.

## Author(s)

Kary Främling

## Examples

```
# Explaining the classification of an Iris instance with lda model.
# We use a versicolor (instance 100).
library(MASS)
test.ind <- 100
iris_test <- iris[test.ind, 1:4]
iris_train <- iris[-test.ind, 1:4]
iris_lab <- iris[[5]][-test.ind]
model <- lda(iris_train, iris_lab)

# Create CIU object
ciu <- ciu.new(model, Species~., iris)

# This can be used with explain method for getting CIU values
# of one or several inputs. Here we get CIU for all three outputs
# with input feature "Petal.Length" that happens to be the most important.
ciu$explain(iris_test, 1)

# It is, however, more convenient to use one of the graphical visualisations.
# Here's one using ggplot.
ciu$ggplot.col.ciu(iris_test)

# LDA creates very sharp class limits, which can also be seen in the CIU
# explanation. We can study what the underlying model looks like using
# plot.ciu and plot.ciu.3D methods. Here is a 3D plot for all three classes
# as a function of Petal Length&Width. Iris #100 (shown as the red dot)
# is on the ridge of the "versicolor" class, which is quite narrow for
# Petal Length&Width.
```

```

ciu$plot.ciu.3D(iris_test,c(3,4),1,main=levels(iris$Species)[1],)
ciu$plot.ciu.3D(iris_test,c(3,4),2,main=levels(iris$Species)[2])
ciu$plot.ciu.3D(iris_test,c(3,4),3,main=levels(iris$Species)[3])

## Not run:
# Same thing with a regression task, the Boston Housing data set. Instance
# #370 has the highest valuation (50k$). Model is gbm, which performs
# decently here. Plotting with "standard" bar plot this time.
# Use something like "par(mai=c(0.8,1.2,0.4,0.2))" for seeing Y-axis labels.
library(caret)
gbm <- train(medv ~ ., Boston, method="gbm", trControl=trainControl(method="cv", number=10))
ciu <- ciu.new(gbm, medv~., Boston)
ciu$barplot.ciu(Boston[370,1:13])

# Same but sort by CI.
ciu$barplot.ciu(Boston[370,1:13], sort = "CI")

# The two other possible plots
ciu$ggplot.col(Boston[370,1:13])
ciu$pie.ciu(Boston[370,1:13])

# Method "plot" for studying the black-box behavior and CIU one input at a time.
ciu$plot.ciu(Boston[370,1:13],13)

## End(Not run)

```

---

ciu.pie

*ciu.pie*

---

## Description

Create a pie chart showing CI as the area of slice and CU on color scale from red to green, via yellow, for the given inputs and the given output.

## Usage

```

ciu.pie(
  ciu,
  instance,
  ind.inputs = NULL,
  ind.output = 1,
  in.min.max.limits = NULL,
  n.samples = 100,
  neutral.CU = 0.5,
  show.input.values = TRUE,
  concepts.to.explain = NULL,
  target.concept = NULL,
  target.ciu = NULL,

```

```

    ciu.meta = NULL,
    color.ramp.below.neutral = NULL,
    color.ramp.above.neutral = NULL,
    sort = NULL,
    decreasing = FALSE,
    main = NULL,
    ...
)

```

## Arguments

ciu	ciu object as created with <code>ciu</code> function (not to be confused with CIU object as created by <code>ciu.new</code> ).
instance	Input values for the instance to explain. Should be a <code>data.frame</code> even though a vector or matrix might work too if input names and other needed metadata can be deduced from the dataset or other parameters given to <code>ciu.new</code> .
ind.inputs	Vector of indices for the inputs to be included in the plot. If NULL then all inputs will be included.
ind.output	Index of output to be explained.
in.min.max.limits	<code>data.frame</code> or <code>matrix</code> with one row per output and two columns, where the first column indicates the minimal value and the second column the maximal value for that output. ONLY NEEDED HERE IF not given as parameter to <code>ciu.new</code> or if the limits are different for this specific instance than the default ones.
n.samples	How many instances to generate for estimating CI and CU. For inputs of type <code>factor</code> , all possible combinations of input values are generated, so this parameter only influences how many instances are (at least) generated for continuous-valued inputs.
neutral.CU	Indicates when the Contextual Utility is considered to be "negative". The default value of 0.5 seems quite logical for most cases.
show.input.values	Include input values after input labels or not. Default is TRUE.
concepts.to.explain	List of concepts to use in the plot, as defined by vocabulary provided as argument to <code>ciu.new</code> . If <code>ind.inputs=NULL</code> , then use <code>concepts.to.explain</code> instead. If both are NULL, then use all inputs.
target.concept	If provided, then calculate CIU of inputs <code>ind.inputs.to.explain</code> relative to the given concept rather than relative to the actual output(s). <code>ind.inputs.to.explain</code> should normally be a subset (or all) of the inputs that <code>target.concept</code> consists of, even though that not required by the CIU calculation. If a <code>target.ciu</code> is provided, then the <code>target.concept</code> doesn't have to be included in the vocabulary gives as parameter to <code>ciu.new</code> (at least for the moment).
target.ciu	<code>ciu.result</code> object previously calculated for <code>target.concept</code> . If a <code>target.concept</code> is provided but <code>target.ciu=NULL</code> , then <code>target.ciu</code> is estimated by a call to <code>ciu.explain</code> with the <code>n.samples</code> value given as a parameter to this call. It may

	be useful to provide <code>target.ciu</code> if it should be estimated using some other (typically greater) value for <code>n.samples</code> than the default one, or if it has already been calculated for some reason.
<code>ciu.meta</code>	If given, then use existing <code>ciu.meta.result</code> rather than calling <a href="#">ciu.meta.explain</a> .
<code>color.ramp.below.neutral</code>	Color ramp function as returned by function <code>colorRamp()</code> . Default color ramp is from red3 to yellow.
<code>color.ramp.above.neutral</code>	Color ramp function as returned by function <code>colorRamp()</code> . Default color ramp is from yellow to darkgreen.
<code>sort</code>	NULL, "CI" or "CU".
<code>decreasing</code>	Set to TRUE for decreasing sort.
<code>main</code>	Text to use as main title.
<code>...</code>	See <a href="#">base::plot</a> .

**Value**

"void", i.e. whatever happens to be result of last instruction.

**Author(s)**

Kary Främling

---

ciu.plot

*ciu.plot*

---

**Description**

Function for plotting out the effect of changing values of one input on one output

**Usage**

```
ciu.plot(
  ciu,
  instance,
  ind.input,
  ind.output,
  in.min.max.limits = NULL,
  n.points = 40,
  main = NULL,
  xlab = NULL,
  ylab = NULL,
  ylim = NULL,
  ...
)
```

**Arguments**

ciu	ciu object as created with <a href="#">ciu</a> function (not to be confused with CIU object as created by <a href="#">ciu.new</a> ).
instance	Input values for the instance to explain. Should be a <a href="#">data.frame</a> even though a vector or <a href="#">matrix</a> might work too if input names and other needed metadata can be deduced from the dataset or other parameters given to <a href="#">ciu.new</a> .
ind.input	Index of input feature to plot.
ind.output	Index of output to plot.
in.min.max.limits	<a href="#">data.frame</a> or <a href="#">matrix</a> with one row per output and two columns, where the first column indicates the minimal value and the second column the maximal value for that output. ONLY NEEDED HERE IF not given as parameter to <a href="#">ciu.new</a> or if the limits are different for this specific instance than the default ones.
n.points	How many x,y pairs will be calculated, equally spaced over in.min.max.limits.
main	Text to use as main title.
xlab	Label for x-axis.
ylab	Label for y-axis.
ylim	Minimal and maximal values for y-axis.
...	See <a href="#">base::plot</a> .

**Value**

"void", or whatever happens to be result of last instruction.

**Author(s)**

Kary Främling

**See Also**

[base::plot](#) for "..." parameters.

---

ciu.plot.3D

*ciu.plot.3D*

---

**Description**

Function for 3D plotting the effect of changing values of two inputs on one output.

**Usage**

```
ciu.plot.3D(
  ciu,
  instance,
  ind.inputs,
  ind.output,
  in.min.max.limits = NULL,
  n.points = 40,
  main = NULL,
  xlab = NULL,
  ylab = NULL,
  zlab = NULL,
  zlim = NULL,
  ...
)
```

**Arguments**

ciu	ciu object as created with <a href="#">ciu</a> function (not to be confused with CIU object as created by <a href="#">ciu.new</a> ).
instance	Input values for the instance to explain. Should be a <a href="#">data.frame</a> even though a vector or matrix might work too if input names and other needed metadata can be deduced from the dataset or other parameters given to <a href="#">ciu.new</a> .
ind.inputs	Indices of input features to plot.
ind.output	Index of output to plot.
in.min.max.limits	<a href="#">data.frame</a> or <a href="#">matrix</a> with one row per output and two columns, where the first column indicates the minimal value and the second column the maximal value for that output. ONLY NEEDED HERE IF not given as parameter to <a href="#">ciu.new</a> or if the limits are different for this specific instance than the default ones.
n.points	Number of x/y-axis points to use.
main	a main title for the plot, see also <a href="#">title</a> .
xlab	a label for the x axis, defaults to a description of x.
ylab	a label for the y axis, defaults to a description of y.
zlab	Label to use for Z-axis. Default: NULL.
zlim	Limits to use for Z-axis. Default: NULL.
...	other <a href="#">graphical parameters</a> (see <a href="#">par</a> and section 'Details' below).

**Value**

"void", or whatever happens to be result of last instruction.

**Author(s)**

Kary Främling

---

ciu.plots.beeswarm     *Create beeswarm-type visualisation.*

---

## Description

Create beeswarm-type visualisation.

## Usage

```
ciu.plots.beeswarm(data, target.columns = c("Feature", "CI", "Norm.Value"))
```

## Arguments

**data**                    A [data.frame](#) with CIU (or other) results that has to have at least the columns:

- Feature: Feature name.
- The CI, CU, influence, whatever actual values to plot.
- Norm.Value: Normalized feature values. This can be omitted. Such a [data.frame](#) is returned by [ciu.explain.long.data.frame](#), from which the "non-relevant" columns have to be removed, however (see examples).

**target.columns**    Character vector with names of the columns to use:

- Column with feature names.
- Column with actual importance/influence/whatever values to plot.
- Column with normalized values to use for determining color. If omitted, then the plot is produced without the colours. Default: c("Feature", "CI", "Norm.Value").

## Value

ggplot object

## Examples

```
## Not run:
# Boston data set with GBM model.
library(MASS)
library(caret)
library(ggbeeswarm)
kfoldcv <- trainControl(method="cv", number=10)
gbm <- caret::train(medv ~ ., Boston, method="gbm", trControl=kfoldcv)
ciu <- ciu.new(gbm, medv~., Boston)
df <- ciu.explain.long.data.frame(ciu)
p <- ciu.plots.beeswarm(df); print(p)
p <- ciu.plots.beeswarm(df, c("Feature", "CU", "Norm.Value")); print(p)
p <- ciu.plots.beeswarm(df, c("Feature", "Influence", "Norm.Value")); print(p)

# Plot without normalized values.
p <- ciu.plots.beeswarm(df, c("Feature", "Influence")); print(p)
```

```
# Shapley value-compatible reference value
mean.utility <- (mean(Boston$medv)-min(Boston$medv))/(max(Boston$medv)-min(Boston$medv))
df <- ciu.explain.long.data.frame(ciu, neutral.CU=mean.utility)
p <- ciu.plots.beeswarm(df, c("Feature", "Influence", "Norm.Value")); print(p)

ciu.relative	<i>Calculate CIU of a sub-concept/input relative to an intermediate concept (or output).</i>
--------------	--

---

### Description

Calculate CIU of a sub-concept/input relative to an intermediate concept (or output). The parameters must be of class "ciu.result" or a [data.frame](#) with compatible columns.

### Usage

```
ciu.relative(sub.ciu.result, sup.ciu.result)
```

### Arguments

sub.ciu.result ciu.result object of sub-concept/input.  
 sup.ciu.result ciu.result object of intermediate concept/output.

### Author(s)

Kary Främling

---

ciu.result.new	<i>CIU result object</i>
----------------	--------------------------

---

### Description

Create object of class ciu.result, which stores results of CIU calculations. The ciu\$explain and [ciu.explain](#) methods return a ciu.result object.

### Usage

```
ciu.result.new(ci, cu, cmin, cmax, outval)
```

**Arguments**

ci	vector of CI values, one per output
cu	vector of CU values, one per output
cmin	vector of cmin values, one per output
cmax	vector of cmax values, one per output
outval	vector of black-box output values, one per output

**Value**

An object of class `ciu.result`, which is a [data.frame](#) with (at least) five columns:

- CI values: one row per output of the black-box model
- CU values: one row per output of the black-box model
- cmin values: one row per output of the black-box model
- cmax values: one row per output of the black-box model
- outval values: one row per output of the black-box model

**Author(s)**

Kary Främling

---

ciu.textual	<i>Give textual CIU explanation</i>
-------------	-------------------------------------

---

**Description**

Provide textual CIU explanations as those used in Kary Främling's PhD thesis.

**Usage**

```
ciu.textual(  
  ciu,  
  instance = NULL,  
  ind.inputs = NULL,  
  ind.output = 1,  
  in.min.max.limits = NULL,  
  n.samples = 100,  
  neutral.CU = 0.5,  
  show.input.values = TRUE,  
  concepts.to.explain = NULL,  
  target.concept = NULL,  
  target.ciu = NULL,  
  ciu.meta = NULL,  
  sort = "CI",  
  n.features = NULL,  
)
```

```

use.text.effects = FALSE,
CI.voc = data.frame(limits = c(0.2, 0.4, 0.6, 0.8, 1), texts = c("not important",
  "slightly important", "important", "very important", "extremely important")),
CU.voc = data.frame(limits = c(0.2, 0.4, 0.6, 0.8, 1), texts = c("very bad", "bad",
  "average", "good", "very good"))
)

```

## Arguments

<code>ciu</code>	ciu object as created with <code>ciu</code> function (not to be confused with CIU object as created by <code>ciu.new</code> ).
<code>instance</code>	Input values for the instance to explain. Should be a <code>data.frame</code> even though a vector or matrix might work too if input names and other needed metadata can be deduced from the dataset or other parameters given to <code>ciu.new</code> .
<code>ind.inputs</code>	Indices of input features to explain (the set {i} in CIU formulae)
<code>ind.output</code>	Index of output to be explained.
<code>in.min.max.limits</code>	<code>data.frame</code> or <code>matrix</code> with one row per output and two columns, where the first column indicates the minimal value and the second column the maximal value for that output. ONLY NEEDED HERE IF not given as parameter to <code>ciu.new</code> or if the limits are different for this specific instance than the default ones.
<code>n.samples</code>	How many instances to generate for estimating CI and CU. For inputs of type <code>factor</code> , all possible combinations of input values are generated, so this parameter only influences how many instances are (at least) generated for continuous-valued inputs.
<code>neutral.CU</code>	Indicates when the Contextual Utility is considered to be "negative". The default value of 0.5 seems quite logical for most cases.
<code>show.input.values</code>	Include input values after input labels or not. Default is TRUE.
<code>concepts.to.explain</code>	List of input feature concepts to explain, as defined by vocabulary provided as argument to <code>ciu.new</code> . If <code>ind.inputs=NULL</code> , then use <code>concepts.to.explain</code> instead. If both are NULL, then use all inputs.
<code>target.concept</code>	If provided, then calculate CIU of inputs <code>ind.inputs.to.explain</code> relative to the given concept rather than relative to the actual output(s). <code>ind.inputs.to.explain</code> should normally be a subset (or all) of the inputs that <code>target.concept</code> consists of, even though that not required by the CIU calculation. If a <code>target.ciu</code> is provided, then the <code>target.concept</code> doesn't have to be included in the vocabulary gives as parameter to <code>ciu.new</code> (at least for the moment).
<code>target.ciu</code>	<code>ciu.result</code> object previously calculated for <code>target.concept</code> . If a <code>target.concept</code> is provided but <code>target.ciu=NULL</code> , then <code>target.ciu</code> is estimated by a call to <code>ciu.explain</code> with the <code>n.samples</code> value given as a parameter to this call. It may be useful to provide <code>target.ciu</code> if it should be estimated using some other (typically greater) value for <code>n.samples</code> than the default one, or if it has already been calculated for some reason.
<code>ciu.meta</code>	If given, then use existing <code>ciu.meta.result</code> rather than calling <code>ciu.meta.explain</code> .

sort	NULL, "CI" or "CU".
n.features	Maximal number of features to include in explanation.
use.text.effects	Add bold/italics/colors effects?
CI.voc	Limits and texts to use for CI values.
CU.voc	Limits and texts to use for CU values.

## Value

Text string with explanation.

## Examples

```
# Explaining the classification of an Iris instance with lda model.
# We use a versicolor (instance 100).
library(MASS)
test.ind <- 100
iris_test <- iris[test.ind, 1:4]
iris_train <- iris[-test.ind, 1:4]
iris_lab <- iris[[5]][-test.ind]
model <- lda(iris_train, iris_lab)

# Create CIU object
ciu <- ciu.new(model, Species~., iris)

# Give textual explanation. Use 'cat' for getting newlines to work.
cat(ciu.textual(ciu, iris_test, ind.output = 2))
cat(ciu.textual(ciu, iris_test, ind.output = 2, n.features = 2))

## Not run:
# Boston housing, GBM model.
library(caret)
kfoldcv <- trainControl(method="cv", number=10)
gbm <- train(medv ~ ., Boston, method="gbm", trControl=kfoldcv)
boston.inst <- Boston[370,1:13]
ciu <- ciu.new(gbm, medv~., Boston)
cat(ciu.textual(ciu, boston.inst, use.text.effects = TRUE))
# Customized limits for CI.
cat(ciu.textual(ciu, boston.inst, use.text.effects = TRUE,
  CI.voc = data.frame(limits=c(0.05,0.1,0.3,0.5,1.0),
  texts=c("not important", "little important", "important", "very important",
  "extremely important"))))

# Intermediate concepts
social<-c(1,11,13); usage_type<-c(2,3); chas<-c(4); air_quality<-c(5)
housing<-c(6,7); transport<-c(8,9); blacks<-c(12); tax<-c(10)
Boston.voc <- list("SOCIAL"=social, "LAND USAGE"=usage_type, "Charles R. dummy"=chas,
"Air quality (Nox)"=air_quality, "HOUSING"=housing, "TRANSPORT"=transport,
"Prop. of black people"=blacks, "Tax"=tax)
ciu <- ciu.new(gbm, medv~., Boston, vocabulary = Boston.voc)
```

```
# We use `meta.explain` here to avoid differences due to sampling.
meta.top <- ciu$meta.explain(boston.inst, concepts.to.explain=names(Boston.voc))
cat(ciu.textual(ciu, boston.inst, use.text.effects = TRUE, ciu.meta = meta.top))

# Explain intermediate concept utility, using input features (could also
# be using other intermediate concepts).
cat(ciu.textual(ciu, boston.inst, use.text.effects = TRUE, ind.inputs = Boston.voc$SOCIAL,
  target.concept = "SOCIAL", target.ciu = meta.top$ciuvals[["SOCIAL"]]))
cat(ciu.textual(ciu, boston.inst, use.text.effects = TRUE, ind.inputs = Boston.voc$HOUSING,
  target.concept = "HOUSING", target.ciu = meta.top$ciuvals[["HOUSING"]]))

## End(Not run)
```

---

ciu.to.CIU

---

*Create CIU object from ciu object.*

---

## Description

A CIU object is an "object-oriented programming" object, i.e. it has its own environment, private variables and methods etc. A CIU object is created using [ciu.new](#) like `ciu_obj <- ciu.new(...)` and the object's methods are then called as `ciu_obj$method(...)`. This approach has numerous advantages but CIU objects consume much more memory than "ordinary" R data structures.

## Usage

```
ciu.to.CIU(ciu)
```

## Arguments

```
ciu          ciu object.
```

## Details

A ciu object is simply a [list](#) that contains all the "object variables" of a CIU object, which is the reason why `CIU <-> ciu` conversions can be done at any time. `CIU -> ciu` conversion doesn't have any overhead but `ciu -> CIU` does require overhead due to the environment setup etc. Therefore, it is advisable to avoid unnecessary `CIU -> ciu` conversions.

ciu objects are very memory-efficient because they are ordinary [list](#) objects (however, make sure that `ciu$CIU` element's value is `NULL`). ciu objects also give direct access to all the object variables that are private in a CIU object.

However, using ciu objects means that they have to be passed as a parameter to all functions that use them. The advantages of object oriented programming are of course lost too.
