

# Package ‘RFOC’

February 7, 2026

**Type** Package

**Title** Graphics for Spherical Distributions and Earthquake Focal Mechanisms

**Version** 3.4-14

**Date** 2026-02-07

**Depends** R ( $\geq 3.1.0$ )

**Imports** RPMG, GEOMap, RSEIS, MASS, fields, rpanel

**Suggests** maps

**Author** Jonathan M. Lees [aut, cre],  
Keehoon Kim [ctb]

**Maintainer** Jonathan M. Lees <jonathan.lees@unc.edu>

**Description** Graphics for statistics on a sphere, as applied to geological fault data, crystallography, earthquake focal mechanisms, radiation patterns, ternary plots and geographical/geological maps. Non-double couple plotting of focal spheres and source type maps are included for statistical analysis of moment tensors.

**License** GPL ( $\geq 2$ )

**NeedsCompilation** no

**Repository** CRAN

**Date/Publication** 2026-02-07 16:50:02 UTC

RFOC-package

*Calculates and plot Earthquake Focal Mechanisms*

---

## Description

Graphics for statistics on a sphere, as applied to geological fault data, crystallography, earthquake focal mechanisms, radiation patterns, ternary plots and geographical/geological maps. Given strike-dip-rake or a set of fault planes, focal planes, RFOC creates structures for manipulating and plotting earthquake focal mechanisms as individual plots or distributed spatially maps.

RFOC can be used for analysis of plane orientation, geologic structure, distribution of stress and strain analyses.

## Details

Visualize focal mechanisms in a number of modes, including: beachball plots, radiation plots, fault planes and ternary diagrams. Shows spatial distribution of spherically distributed data.

## Examples

```
##### plot one focal mechanism:
M = SDRfoc(-25, 34, 16,u = FALSE, ALIM = c(-1, -1, +1, +1), PLOT=TRUE)
```

```
##### plot many P-axes:
paz = rnorm(100, mean=297, sd=100)
pdip = rnorm(100, mean=52, sd=20)
net()
focpoint(paz, pdip, col='red', pch=3, lab="", UP=FALSE)
```

```
#####
```

```
#### Show many Focal mechanisms on a plot:
```

```
Z1 = c(159.33,51.6,206,18,78,
161.89,54.5,257,27,133,

177.95,51.14,-83,25,126,
178.25,51.18,215,16,27
)
```

```
MZ = matrix(Z1, ncol=5, byrow=TRUE)
```

```
plot(MZ[,1], MZ[,2], type='n', xlab="LON", ylab="LAT", asp=1)
```

```
for(i in 1:length(MZ[,1]))
{
paste(MZ[i,3], MZ[i,4], MZ[i,5])
}
```

```

MEC = SDRfoc(MZ[i,3], MZ[i,4], MZ[i,5], u=FALSE, ALIM=c(-1,-1, +1, +1), PLOT=FALSE)
fcol = foc.color(foc.icolor(MEC$rake1), pal=1)
justfocXY(MEC, x=MZ[i,1], y =MZ[i,2] , focsiz=0.5, fcol =fcol , fcolback = "white", xpd = TRUE)

}

```

---

addmecpoints

*Add points to Focal Mech*

---

### Description

Add a standard set of points to a Focal Mechanism

### Usage

```
addmecpoints(MEC, pch = 5)
```

### Arguments

|     |                    |
|-----|--------------------|
| MEC | MEC structure list |
| pch | plotting character |

### Value

Graphical Side effects

### Author(s)

Jonathan M. Lees<[jonathan.lees@unc.edu](mailto:jonathan.lees@unc.edu)>

### See Also

SDRfoc, focpoint

### Examples

```

MEC= SDRfoc(12,34,-120)
addmecpoints(MEC)

```

---

|       |                                   |
|-------|-----------------------------------|
| addPT | <i>Add P-T Axis to focal plot</i> |
|-------|-----------------------------------|

---

**Description**

Add Pressure and tension Axes to focal mechanism

**Usage**

```
addPT(MEC, pch = 5)
```

**Arguments**

|     |                    |
|-----|--------------------|
| MEC | MEC structure      |
| pch | plotting character |

**Value**

Graphical Side Effect

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

addPTarrows

**Examples**

```
MEC =SDRfoc(65,25,13, u=FALSE, ALIM=c(-1,-1, +1, +1), PLOT=FALSE)
Beachfoc(MEC)
addPT(MEC, pch = 5)
```

---

|             |                            |
|-------------|----------------------------|
| addPTarrows | <i>Add fancy 3D arrows</i> |
|-------------|----------------------------|

---

**Description**

Illustrate Pressure and Tension axis on Focal Plot using 3D arrows

**Usage**

```
addPTarrows(MEC)
```

**Arguments**

MEC                      Mechanism Structure

**Value**

Graphical Side Effects

**Note**

This function looks better when plotting the upper hemisphere

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

focpoint, BOXarrows3D, Z3Darrow

**Examples**

```
MEC = SDRfoc(65,25,13, u=TRUE, ALIM=c(-1,-1, +1, +1), PLOT=TRUE)

addPTarrows(MEC)
```

---

addsmallcirc

*Small Circle on Stereonet*

---

**Description**

Calculate and plot small circle on Stereo net at arbitrary azimuth, orientation and conical angle

**Usage**

```
addsmallcirc(az, iang, alphadeg, BALL.radius = 1, N = 100, add = TRUE, ...)
```

**Arguments**

|             |                                    |
|-------------|------------------------------------|
| az          | Azimuth of axis                    |
| iang        | angle of dip, degrees              |
| alphadeg    | width of cone in degrees           |
| BALL.radius | size of sphere                     |
| N           | Number of points to calculate      |
| add         | logical, TRUE=add to existing plot |
| ...         | graphical parameters               |

**Details**

Given the azimuth and dip of a vector, plot the small circle around the pole with conical angle alphadeg

**Value**

LIST:

x                    x-coordinates

y                    y-coordinates

**Note**

alphadeg is the radius of the conic projection

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

net

**Examples**

```
net()
addsmallcirc(65, 13, 20, BALL.radius = 1, N = 100, add = TRUE)
addsmallcirc(165, 73, 5.6, BALL.radius = 1, N = 100, add = TRUE)
```

---

AlongGreat

*Get Points Along Great Circle*

---

**Description**

Using a Starting LAT-LON, return points along an azimuth

**Usage**

```
AlongGreat(LON1, LAT1, km1, ang, EARTHRADE = 6371)
```

**Arguments**

|           |                                       |
|-----------|---------------------------------------|
| LON1      | Longitude, point                      |
| LAT1      | Latitude, point                       |
| km1       | Kilometers in direction ang           |
| ang       | Direction from North                  |
| EARTHRAID | optional earth radius, default = 6371 |

**Details**

Returns LAT-LON points along a great circle, so many kilometers away in a specified direction

**Value**

LIST:

|         |                              |
|---------|------------------------------|
| lat     | Latitude, destination point  |
| lon     | Longitude, destination point |
| distdeg | distance in degrees          |
| distkm  | distance in km               |

**Author(s)**

Jonathan M. Lees <jonathan.lees@unc.edu>

**Examples**

```
london = c(51.53333, -0.08333333)
```

```
AlongGreat(london[2], london[1], 450, 56)
```

---

alpha95

---

*95 percent confidence for Spherical Distribution*

---

**Description**

Calculates conical projection angle for 95% confidence bounds for mean of spherically distributed data.

**Usage**

```
alpha95(az, iang)
```

**Arguments**

|      |                             |
|------|-----------------------------|
| az   | vector of azimuths, degrees |
| iang | vector of dips, degrees     |

**Details**

Program calculates the cartesian coordinates of all poles, sums and returns the resultant vector, its azimuth and length (R). For N points, statistics include:

$$K = \frac{N - 1}{N - R}$$

$$S = \frac{81^\circ}{\sqrt{K}}$$

$$\kappa = \frac{\log(\frac{\epsilon_1}{\epsilon_2})}{\log(\frac{\epsilon_2}{\epsilon_3})}$$

$$\alpha_{95} = \cos^{-1} \left[ 1 - \frac{N - R}{R} \left( 20^{\frac{1}{N-1}} - 1 \right) \right]$$

where  $\epsilon$ 's are the relevant eigenvalues of matrix MAT and angles are in degrees.

**Value**

LIST:

|        |                                      |
|--------|--------------------------------------|
| Ir     | resultant inclination, degrees       |
| Dr     | resultant declination, degrees       |
| R      | resultant sum of vectors, normalized |
| K      | K-dispersion value                   |
| S      | spherical variance                   |
| Alph95 | 95% confidence angle, degrees        |
| Kappa  | log ratio of eigenvectors            |
| E      | Eigenvectors                         |
| MAT    | matrix of cartesian vectors          |

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

addsmallicirc

## Examples

```
paz = rnorm(100, mean=297, sd=10)
pdip = rnorm(100, mean=52, sd=8)
ALPH = alpha95(paz, pdip)

##### draw stereonet
net()
##### add points
focpoint(paz, pdip, col='red', pch=3, lab="", UP=FALSE)
##### add 95 percent confidence bounds
addsmalldisc(ALPH$Dr, ALPH$Ir, ALPH$Alph95, BALL.radius = 1, N = 25,
add = TRUE, lwd=1, col='blue')

##### second example:
paz = rnorm(100, mean=297, sd=100)
pdip = rnorm(100, mean=52, sd=20)
ALPH = alpha95(paz, pdip)

net()
focpoint(paz, pdip, col='red', pch=3, lab="", UP=FALSE)

addsmalldisc(ALPH$Dr, 90-ALPH$Ir, ALPH$Alph95, BALL.radius = 1, N = 25,
add = TRUE, lwd=1, col='blue')
```

---

AXpoint

---

*Extract Axis pole on Stereonet*

---

## Description

Interactive extract axis point on Stereonet

## Usage

```
AXpoint(UP = TRUE, col=2, n=1)
```

## Arguments

|     |                                             |
|-----|---------------------------------------------|
| UP  | logical, TRUE=upper hemisphere              |
| col | plotting color                              |
| n   | maximum number to locate, default=unlimited |

## Details

Program uses locator to create a vector of poles. Points outside the focal sphere ( $r > 1$ ) are ignored. If n is missing, locator continues until stopped (middle mouse in linux, stop in windows).

**Value**

|        |                                  |
|--------|----------------------------------|
| phiang | azimuth angle, degrees           |
| dip    | dip angle, degrees               |
| x      | x-coordinate of cartesian vector |
| y      | y-coordinate of cartesian vector |
| z      | z-coordinate of cartesian vector |
| gx     | x-coordinate of prjection        |
| gy     | y-coordinate of prjection        |

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

locator, qpoint, EApoint

**Examples**

```
##### this is interactive
if(interactive()){
  net()
  Z = AXpoint(UP = TRUE)

  ## click in steronet
  Z
}
```

---

bang

---

*Angle between two 2D normalized vectors*

---

**Description**

Calculates the angle between two 2D normalized vectors using dot and cross product

**Usage**

```
bang(x1, y1, x2, y2)
```

**Arguments**

|    |                                          |
|----|------------------------------------------|
| x1 | x coordinate of first normalized vector  |
| y1 | y coordinate of first normalized vector  |
| x2 | x coordinate of second normalized vector |
| y2 | y coordinate of second normalized vector |

**Details**

The sign of angle is determined by the sign of the cross product of the two vectors.

**Value**

angle in radians

**Note**

Vectors must be normalized prior to calling this routine. Used mainly for vectors on the unit sphere.

**Author(s)**

Jonathan M. Lees <jonathan.lees@unc.edu>

**Examples**

```
v1 = c(5,3)
v2 = c(6,1)

a1 = c(5,3)/sqrt(v1[1]^2+v1[2]^2)
a2 = c(6,1)/sqrt(v2[1]^2+v2[2]^2)

```

---

Beachfoc

---

*Plot a BeachBall Focal Mechanism*

---

**Description**

Plots a focal mechanism in beachball style

**Usage**

```
Beachfoc(MEC, fcol = gray(0.9), fcolback = "white", ALIM = c(-1, -1, +1, +1))
```

**Arguments**

|          |                                                                    |
|----------|--------------------------------------------------------------------|
| MEC      | Mechanism Structure                                                |
| fcol     | color for the filled portion of the beachball                      |
| fcolback | color for the background portion of the beachball, default='white' |
| ALIM     | Bounding box for beachball, default=c(-1, -1, +1, +1)              |

**Details**

Beachfoc is run after MEC is set using SDRfoc. Options for plotting the beachball in various modes are controlled by flags set in MEC

**Value**

Used for its graphical side effect

```

```
Beachfoc(MEC, fcol=MEC$fcol, fcolback="white")
```

---

Bfocvec

*Angles for Ternary plot*

---

**Description**

Calculates Angles for determining ternary distribution of faults based on P-T axis orientation.

**Usage**

```
Bfocvec(Paz, Pdip, Taz, Tdip)
```

**Arguments**

|      |                             |
|------|-----------------------------|
| Paz  | vector of azimuths, degrees |
| Pdip | vector of dips, degrees     |
| Taz  | vector of azimuths, degrees |
| Tdip | vector of dips, degrees     |

**Details**

This calculation is based on Froelich's paper.

**Value**

LIST:

|      |                   |
|------|-------------------|
| Bdip | azimuths, degrees |
| Baz  | dips, degrees     |

---

`BOXarrows3D`*Create a 3D Arrow structure*

---

**Description**

Create and project and plot 3D arrows with viewing Matrix.

**Usage**

```
BOXarrows3D(x1, y1, z1, x2, y2, z2, aglyph = NULL, Rview = ROTX(0),  
col = grey(0.5), border = "black", len = 0.7, basethick = 0.05,  
headlen = 0.3, headlip = 0.02)
```

**Arguments**

|                        |                                      |
|------------------------|--------------------------------------|
| <code>x1</code>        | x-coordinates of base of arrows      |
| <code>y1</code>        | y-coordinates of base of arrows      |
| <code>z1</code>        | z-coordinates of base of arrows      |
| <code>x2</code>        | x-coordinates of head of arrows      |
| <code>y2</code>        | y-coordinates of head of arrows      |
| <code>z2</code>        | z-coordinates of head of arrows      |
| <code>aglyph</code>    | glyph structure, default is Z3Darrow |
| <code>Rview</code>     | Viewing matrix                       |
| <code>col</code>       | fill color                           |
| <code>border</code>    | Border color                         |
| <code>len</code>       | Length                               |
| <code>basethick</code> | thickness of the base                |
| <code>headlen</code>   | thickness of the head                |
| <code>headlip</code>   | width of the overhanging lip         |

**Details**

Arrows point from base to head.

**Value**

Used for graphical side effects.

**Note**

Any 3D glyph structure can be used

N = CROSSL(A1, A2)
```

doNonDouble

*Plot Non-double Couple Moment***Description**

Plot Non-double Couple Moment

**Usage**

```
doNonDouble(moments, sel = 1, col=rgb(1, .75, .75))
```

**Arguments**

|         |                                                       |
|---------|-------------------------------------------------------|
| moments | list of moments: seven elements. See details.         |
| sel     | integer vector, index of moments to plot              |
| col     | color, either a single color, rgb, or a color palette |

**Details**

Plot, sequentially the moments using the CLVD (non-double couple component. The first element of the list is the integer index of the event. The next six elements are the moments in the following order, c(Mxx, Myy, Mzz, Mzy, Mxz, Mxy) .

If the data is in spherical coordinates, one must switch the sign of the Mrp and Mtp components, so:

```
Mrr = Mzz
Mtt = Mxx
Mpp = Myy
Mrt = Mxz
Mrp = -Myz
Mtp = -Mxy
```

**Value**

Side effects

**Note**

If events are read in using spherical rather than cartesian coordinates need a conversion:

```
Mrr = Mzz
Mtt = Mxx
Mpp = Myy
Mrt = Mxz
Mrp = -Myz
Mtp = -Mxy
```

---

fancyarrows

*Make fancy arrows*

---

## Description

Create and plot fancy arrows. Aspect ratio must be set to 1-1 for these arrows to plot correctly.

## Usage

```
fancyarrows(x1, y1, x2, y2, thick = 0.08,
            headlength = 0.4, headthick = 0.2, col = grey(0.5),
            border = "black")
```

## Arguments

|            |                    |
|------------|--------------------|
| x1         | x tail coordinate  |
| y1         | y tail coordinate  |
| x2         | x head coordinate  |
| y2         | y head coordinate  |
| thick      | thickness of arrow |
| headlength | length of head     |
| headthick  | thickness of head  |
| col        | fill color         |
| border     | color of border    |

## Value

Graphical side effects.

## Note

fancyarrows only work if the aspect ratio is set to 1. See example below.

## Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

TEACHFOC

**Examples**

```

    thick = 0.01; headlength = 0.2; headthick = 0.1

x = runif(10, -1, 1)
y = runif(10, -1, 1)

##### MUST set asp=1 here
plot(x,y, asp=1)

fancyarrows(rep(0, 10) , rep(0, 10) ,x, y,
thick =thick , headlength = headlength,
headthick =headthick)

```

---

faultplane

*fault plane projection on focal sphere*

---

**Description**

given azimuth and dip of fault mechanism, calculate and plot the fault plane.

**Usage**

```
faultplane(az, dip, col = par("col"), PLOT = TRUE, UP = FALSE, lwd=2, lty=1, ...)
```

**Arguments**

|      |                                                     |
|------|-----------------------------------------------------|
| az   | degrees, strike of the plane (NOT down dip azimuth) |
| dip  | degrees, dip from horizontal                        |
| col  | color for line                                      |
| PLOT | option for adding to plot                           |
| UP   | upper or lower hemisphere                           |
| lwd  | Line Width                                          |
| lty  | Line Type                                           |
| ...  | graphical parameters                                |

**Details**

Azimuth is the strike in degrees, not the down dip azimuth as described in other routines.

**Value**

list of points along fault plane

x coordinates on focal sphere

y coordinates on focal sphere

**Author(s)**

Jonathan M. Lees <jonathan.lees@unc.edu>

**See Also**

border='black'
ndiv=36
phi = seq(0,2*pi, by=2*pi/ndiv);
x = cos(phi);
y = sin(phi);

plot(x,y, type='n', asp=1)
lines(x,y, col=border)
lines(c(-1,1), c(0,0), col=gcol)
lines(c(0,0), c(-1,1), col=gcol)

faultplane(65, 34)
```

---

FixDip

*Fix Dip Angle*

---

**Description**

Fix az, dip angles so they fall in correct quadrant.

**Usage**

FixDip(A)

**Arguments**

List:

A **az** azimuthm angle, degrees  
**dip** dip angle, degrees

**Details**

Quadrants are determined by the sine and cosine of the dip angle:  $co = \cos(dip)$   $si = \sin(dip)$   
 $quad[co \geq 0 \ \& \ si \geq 0] = 1$   $quad[co < 0 \ \& \ si \geq 0] = 2$   $quad[co < 0 \ \& \ si < 0] = 3$   $quad[co \geq 0 \ \& \ si < 0]$   
 $= 4$

**Value**

List:

|     |                         |
|-----|-------------------------|
| az  | azimuthm angle, degrees |
| dip | dip angle, degrees      |

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

**Examples**

```
B = list(az=231, dip = -65)
```

```
FixDip(B)
```

---

flipnodal

*Flip Nodal Fault Plane*

---

**Description**

Switch a focal mechanism so the auxilliary plane is the nodal plane.

**Usage**

```
flipnodal(s1, d1, r1)
```

**Arguments**

|    |        |
|----|--------|
| s1 | Strike |
| d1 | Dip    |
| r1 | Rake   |

**Details**

Fufunction is used for orienting a set of fault planes to line up according to a geologic interpretation.

**Value**

List:

|    |        |
|----|--------|
| s1 | Strike |
| d1 | Dip    |
| r1 | Rake   |

**Author(s)**

Jonathan M. Lees&lt;jonathan.lees@unc.edu&gt;

**Examples**

```

s=65
d=25
r=13

mc = CONVERTSDR(s,d,r )

mc2 = flipnodal(s, d, r)

```

foc.color

*Get color of Focal Mechansim***Description**

Based on the rake angle, focal styles are assigned an index and assigned a color by foc.color

**Usage**

```
foc.color(i, pal = 0)
```

**Arguments**

|     |                                       |
|-----|---------------------------------------|
| i   | index to list of focal rupture styles |
| pal | vector of colors                      |

**Details**

Since the colors used by focal programs are arbitrary, this routines allows one to change the coloring scheme easily.

foc.icolor returns an index that is used to get the color associated with that style of faulting

**Value**

Color for plotting, either a name or HEX RGB

**Author(s)**

Jonathan M. Lees <jonathan.lees@unc.edu>

**See Also**

foc.icolor

**Examples**

```
fcolors=c("DarkSeaGreen", "cyan1", "SkyBlue1", "RoyalBlue", "GreenYellow", "orange", "red")
foc.color(3, fcolors)
```

---

foc.icolor

*Get Fault Style*

---

**Description**

Use Rake Angle to determine style of faulting

**Usage**

```
foc.icolor(rake)
```

**Arguments**

rake                      degrees, rake angle of fault plane

**Details**

The styles are determined by the rake angle

strikeslip  $\text{abs}(\text{rake}) \leq 15.0$  or  $\text{abs}((180.0 - \text{abs}(\text{rake}))) \leq 15.0$

rev-obl strk-slp  $(\text{rake} \geq 15.0 \text{ and } \text{rake} < 45)$  or  $(\text{rake} \geq 135 \text{ and } \text{rake} < 165)$

oblique reverse  $(\text{rake} \geq 45.0 \text{ and } \text{rake} < 75)$  or  $(\text{rake} \geq 105 \text{ and } \text{rake} < 135)$

reverse  $\text{rake} \geq 75.0 \text{ and } \text{rake} < 105.0$

norm-oblq strk-slp  $(\text{rake} < -15.0 \text{ and } \text{rake} \geq -45)$  or  $(\text{rake} < -135 \text{ and } \text{rake} \geq -165)$

oblq norm  $(\text{rake} < -45.0 \text{ and } \text{rake} \geq -75)$  or  $(\text{rake} < -105 \text{ and } \text{rake} \geq -135)$

normal  $\text{rake} < -75.0 \text{ and } \text{rake} \geq -105$

**Value**

index (1-6)

**Author(s)**

Jonathan M. Lees <jonathan.lees@unc.edu>

**See Also**

foc.color

**Examples**

```
foc.icolor(25)
```

---

FOCangles

*Angles for focal planes*

---

**Description**

Angles for focal planes

**Usage**

```
FOCangles(m)
```

**Arguments**

m                      moment tensor

**Details**

Used in MapNonDouble and doNonDouble

**Value**

vector of 6 angles, 3 for each plane

**Note**

Lower Hemisphere.

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

MapNonDouble, doNonDouble, PTaxes, nodalLines

Examples

```
mo = list(n=1, m1=1.035675e+017, m2=-1.985852e+016,
          m3=-6.198052e+014, m4=1.177936e+017,
          m5=-7.600627e+016, m6=-3.461405e+017)

moments = cbind(mo$n, mo$m1, mo$m2, mo$m3, mo$m4, mo$m5, mo$m6)

di = dim(moments)
number.of.events = di[1]
moment_11 = moments[,2]

            moment_12[i],moment_22[i],moment_23[i],
            moment_13[i],moment_23[i],moment_33[i]), ncol=3, byrow=TRUE)

angles.all = FOCangles(m)
print(angles.all)
```

---

|        |                               |
|--------|-------------------------------|
| focleg | <i>Fault style descriptor</i> |
|--------|-------------------------------|

---

Description

Get character string describing type of fault from its style index

Usage

```
focleg(i)
```

Arguments

i                      index to vector of focal styles

Value

character string used for setting text on plots

**Note**

String of characters:

**STRIKESLIP** Strike slip fault

**REV-OBL STRK-SLP** Reverse Oblique strike-slip fault

**REVERSE** Reverse fault

**NORM-OBLQ STRKS LP** Normal Oblique strike-slip fault

**OBLQ NORM** Oblique Normal fault

**NORMAL** Normal fault

---

focpoint

*add point on focal sphere*

---

**Description**

Add points on equal-area focal plot

**Usage**

```
focpoint(az1, dip1, col = 2, pch = 5, lab = "", cex=1, UP = FALSE, PLOT = TRUE, ...)
```

**Arguments**

|      |                                               |
|------|-----------------------------------------------|
| az1  | degrees, azimuth angle                        |
| dip1 | degrees, dip angle                            |
| col  | color                                         |
| pch  | plot character for point                      |
| lab  | text label for point                          |
| cex  | Character Size                                |
| UP   | upper or lower hemisphere                     |
| PLOT | logical, PLOT=TRUE add points to current plot |
| ...  | graphical parameters                          |

**Value**

List of x,y coordinates on the plot

**Author(s)**

Jonathan M. Lees <jonathan.lees@unc.edu>

**See Also**

Beachfoc, addmecpoints

**Examples**

```
### create focal mech
ALIM=c(-1,-1, +1, +1)
s=65
d=25
r=13
mc = CONVERTSDR(s,d,r )
MEC = MRake(mc$M)
MEC$UP = FALSE
MEC$icol = foc.icolor(MEC$rake1)

MEC$fcol = foc.color(MEC$icol)
MEC$CNVRG = NA
MEC$LIM = ALIM

### plot focal mech
Beachfoc(MEC, fcol=MEC$fcol, fcolback="white")

### now add the F anf G axes
focpoint(MEC$F$az, MEC$F$dip, pch=5, lab="F", UP=MEC$UP)
focpoint(MEC$G$az, MEC$G$dip, pch=5, lab="G", UP=MEC$UP)
```

---

forcerighthand

*Force Right-Hand System*

---

**Description**

Force Right-Hand System

**Usage**

forcerighthand(U)

**Arguments**

U                      3 by 3 matrix

**Details**

Flip vectors so they form a right handed system

**Value**

matrix

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

testrightHAND

**Examples**

```
Mtens = c(-0.412, 0.084, 0.328 ,0.398, -1.239, 1.058)

Mtens[6], Mtens[5],Mtens[6], Mtens[3]), ncol=3, nrow=3, byrow=TRUE)
E1 = eigen(M1)
testrightHAND(E1$vectors)

E1$vectors = forcerighthand(E1$vectors)

testrightHAND(E1$vectors)
```

---

getCMT

*Read CMT*

---

**Description**

Read and reformat CMT solutions downloaded from the web.

**Usage**

```
getCMT(fn, skip=1)
```

**Arguments**

|      |                                       |
|------|---------------------------------------|
| fn   | character file name                   |
| skip | number of lines to skip (e.g. header) |

**Details**

Data can be extracted from web site: <http://www.globalcmt.org/CMTsearch.html>

The file must be cleaned prior to scanning - on download from the web site there are extra lines on top and bottom of file. Delete these. Leave one line on the top that describes the columns. Data is separated by blanks. The files have a mixture of dates - some with 7 component dates (YYMMDD) and others with 14 components YYYYMMDDHHMM these are read in separately. Missing hours and minutes are set to zero.

**Value**

list of CMT solution data:

|       |                                           |
|-------|-------------------------------------------|
| lon   | lon of epicenter                          |
| lat   | lat of epicenter                          |
| str1  | strike of fault plane                     |
| dip1  | dip of fault plane                        |
| rake1 | rake of fault plane                       |
| str2  | strike of auxilliary plane                |
| dip2  | dip of auxilliary plane                   |
| rake2 | rake of auxilliary plane                  |
| sc    | scale?                                    |
| iexp  | exponent?                                 |
| name  | name, includes the date                   |
| Elat  | exploding latitude, set to lat initially  |
| Elon  | exploding longitude, set to lon initially |
| jd    | julian day                                |
| yr    | year                                      |
| mo    | month                                     |
| dom   | day of month                              |

**Note**

Use ExplodeSymbols or explode to get new locations for expanding the plotting points.

}
```

---

GetRake

---

*Calculate Rake angles*

---

**Description**

Calculates rake angles for fault and auxilliary planes

**Usage**

```
GetRake(az1, dip1, az2, dip2, dir)
```

**Arguments**

|      |                                          |
|------|------------------------------------------|
| az1  | azimuth in degrees of fault plane 1      |
| dip1 | dip in degrees of fault plane 1          |
| az2  | azimuth in degrees of auxilliary plane 2 |
| dip2 | dip in degrees of auxilliary plane 2     |
| dir  | polarity                                 |

**Details**

uses output of CONVERTSDR or MEC structure

**Value**

list of angles for fault plane and auxiallary plane

az1, dip1, rake1, dipaz1  
strike, dip rake and downdip direction for plane 1

az2, dip2, rake2, dipaz2  
strike, dip rake and downdip direction for plane 2

**Author(s)**

Jonathan M. Lees <jonathan.lees@unc.edu>

**See Also**

---

|              |                       |
|--------------|-----------------------|
| GetRakeSense | <i>Get Rake Sense</i> |
|--------------|-----------------------|

---

**Description**

Get the sense of the focal mechanism rake, from the U, V, P, T vectors

**Usage**

GetRakeSense(uaz, upl, vaz, vpl, paz, ppl, taz, tpl)

**Arguments**

|     |                     |
|-----|---------------------|
| uaz | Azimuth of U vector |
| upl | dip of U vector     |
| vaz | Azimuth of V vector |
| vpl | dip of V vector     |
| paz | Azimuth of P vector |
| ppl | dip of P vector     |
| taz | Azimuth of T vector |
| tpl | dip of T vector     |

**Value**

1, 0 to make sure the region of the T-axis is shaded and the P-axis is blank.

**Note**

The convention is for the T-axis to be shaded, so this subroutine determines the order of the polygons to be plotted so that the appropriate regions are filled.

```

---

getUWfocs

*Get UW focals*

---

**Description**

Get UW focal mechanisms from a file. These are often called A and M cards

**Usage**

```
getUWfocs(amfile)
```

**Arguments**

amfile                      character, file name

**Details**

UW focal mechanisms are stored as A and M cards. The A card describes the hypocenter the M card describes the focal mechanism.

**Value**

List:

|       |                                    |
|-------|------------------------------------|
| lon   | numeric, longitude                 |
| lat   | numeric, latitude                  |
| str1  | numeric, strike of plane 1         |
| dip1  | numeric, dip of plane 1            |
| rake1 | numeric, rake of plane 1           |
| str2  | numeric, strike of plane 2         |
| dip2  | numeric, dip of plane 2            |
| rake2 | numeric, rake of plane 2           |
| sc    | character, some GMT info for scale |
| iexp  | character, some GMT info for scale |
| name  | character, name                    |
| yr    | numeric, year                      |
| mo    | numeric, month                     |
| dom   | numeric, day of month              |
| jd    | numeric, julian day                |
| hr    | numeric, hour                      |
| mi    | numeric, minute                    |
| se    | numeric, second                    |
| z     | numeric, depth                     |
| mag   | numeric, magnitude                 |

**Note**

Uses UW2 format, so full 4 digit year is required

imageP

*P-wave radiation pattern*

---

**Description**

Amplitude of P-wave radiation pattern from Double-Couple earthquake

**Usage**

```
imageP(phiS, del, lam, SCALE = FALSE, UP = FALSE, col = NULL)
```

**Arguments**

|       |                                         |
|-------|-----------------------------------------|
| phiS  | strike                                  |
| del   | dip                                     |
| lam   | lambda                                  |
| SCALE | logical, TRUE=add scale on side of plot |
| UP    | upper/lower hemisphere                  |
| col   | color                                   |

**Details**

This program calls radP to calculate the radiation pattern and it plots the result using the standard image function

**Value**

Used for the graphical side effect

**Author(s)**

Jonathan M. Lees <jonathan.lees@unc.edu>

**References**

|------------|-----------------------------------|
| imageSCALE | <i>add scale on side of image</i> |
|------------|-----------------------------------|

---

**Description**

add scale to side of an image plot

**Usage**

```
imageSCALE(z, col, x, y = NULL, size = NULL, digits = 2,
labels = c("breaks", "ranges"), nlab = 10)
```

**Arguments**

|        |                                |
|--------|--------------------------------|
| z      | elevation matrix               |
| col    | palette for plotting           |
| x      | x location on plot             |
| y      | y location on plot             |
| size   | length of scale                |
| digits | digits on labels               |
| labels | breaks to be plotted           |
| nlab   | number of breaks to be plotted |

**Value**

Used for graphical side effect

**Author(s)**

Jonathan M. Lees <jonathan.lees@unc.edu>

**Examples**

```
data(volcano)
image(volcano, col=rainbow(100) )

imageSCALE(volcano, rainbow(100), 1.015983, y = 0.874668,
size = .01, digits =

```

---

inverseTAPE

---

*Inverse Moment Tensor*

---

**Description**

Inverse moment tensor from Tape angles.

**Usage**

```
inverseTAPE(GAMMA, BETA)
```

**Arguments**

|       |                     |
|-------|---------------------|
| GAMMA | Longitude, degrees  |
| BETA  | CoLatitude, degrees |

**Details**

Uses Tape and Tape lune angles to estimate the moment tensor. This function is the inverse of the SourceType calculation. There are two solutions to the systems of equations.

Vectors are scaled by the maximum value.

**Value**

Moment tensor list:

|    |                        |
|----|------------------------|
| Va | vector, First solution |
| Vb | vector, First solution |

**Note**

The latitude is the CoLatitude.

Either vector can be used as a solution.

Orientation of moment tensor is not preserved in the lune plots.

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**References**

Tape, W., and C. Tape (2012), A geometric comparison of source-type plots for moment tensors, Geophys. J. Int., 190, 499-510.

---

JMAT

---

*Vertical Rotation matrix*

---

**Description**

Vertical Rotation matrix

**Usage**

JMAT(phi)

**Arguments**

phi                      angle, degrees

**Details**

First rotate to plan, then within plane rotate to view angle.

**Value**

3 by 3 matrix

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

ROTX, ROTZ, ROTY

**Examples**

```
phi = 18  
  
MAT = JMAT(phi)  
  
v1 = c(1,1,0)  
  
v2 = MAT
```

---

justfocXY

*Plot focal mechanism*

---

**Description**

Add simple focal mechanisms to plot

**Usage**

```
justfocXY(MEC, x = x, y = y, focsiz=1 , fcol = gray(0.9),  
          fcolback = "white", xpd = TRUE)
```

**Arguments**

|          |                                                        |
|----------|--------------------------------------------------------|
| MEC      | MEC structure                                          |
| x        | x-coordinate of center                                 |
| y        | y-coordinate of center                                 |
| focsiz   | size of focal sphere in inches                         |
| fcol     | color of shaded region                                 |
| fcolback | color of background region                             |
| xpd      | logical, whether to extend the plot beyond, or to clip |

**Details**

This routine can be used to add focal mechanisms on geographic map or other plot.

**Value**

Used for graphical side effect

**Author(s)**

Jonathan M. Lees <jonathan.lees@unc.edu>

---

lowplane

---

*Plot one Fault plane on stereonet*

---

## Description

takes azimuth and dip and projects the great circle on the focal sphere

## Usage

```
lowplane(az, dip, col = par("col"), UP = FALSE, PLOT = TRUE)
```

## Arguments

|      |                                     |
|------|-------------------------------------|
| az   | degrees, azimuth of strike of plane |
| dip  | degrees, dip                        |
| col  | color of plane                      |
| UP   | upper/lower hemisphere              |
| PLOT | add to plot                         |

## Details

Here azimuth is measured from North, and represents the actual strike of the fault line.

**Value**

list of x,y coordinates of plane

MapNonDouble

*Map moment tensors*

---

## Description

Plot moment tensors on map

## Usage

```
MapNonDouble(Locs, moments, sel = 1, siz = 0.2,
col=rgb(1, .75, .75), PLANES = TRUE, add = FALSE, LEG=FALSE)
```

## Arguments

|         |                                                                                |
|---------|--------------------------------------------------------------------------------|
| Locs    | Locations, x,y                                                                 |
| moments | list of moments: seven elements. See details.                                  |
| sel     | integer, index of which to plot                                                |
| siz     | size to plot, inches                                                           |
| col     | color, either a single color, rgb, or a color palette.                         |
| PLANES  | logical, whether to add nodal planes, default=TRUE                             |
| add     | logical, whether to add to plot, default=FALSE                                 |
| LEG     | logical, whether to add focal mech legend based on color coding, default=FALSE |

## Details

Moment tensors are added to an existing plot. The first element of the list is the integer index of the event. The next six elements are the moments in the following order, c(Mxx, Myy, Mzz, Mzy, Mxz, Mxy) .

If the data is in spherical coordinates, one must switch the sign of the Mrp and Mtp components, so:

```
Mrr = Mzz
Mtt = Mxx
Mpp = Myy
Mrt = Mxz
Mrp = -Myz
Mtp = -Mxy
```

A color palette can be provided for some details of the radiation patterns, e.g. col=rainbow(12). If col is NULL, the colors will be chosen according to focal.color from RFOC, based on rake of first nodal plane.

If col is NULL, then the colors are set by foc.color and it is appropriate to add a legend.

**Value**

list:

|     |                                                   |
|-----|---------------------------------------------------|
| FOC | matrix, focal mechanism angles (strike, dip rake) |
| LAB | matrix, x-y location for labels                   |

**Note**

If events are read in using spherical rather than cartesian coordinates need a conversion:

```

Mrr = Mzz
Mtt = Mxx
Mpp = Myy
Mrt = Mxz
Mrp = -Myz
Mtp = -Mxy

```

```

---

mc2cart

---

*Convert azimuth, dip to Cartesian Coordinates*

---

## Description

takes the pole information from a stereoplot and returns the cartesian coordinates

## Usage

```
mc2cart(az, dip)
```

## Arguments

|     |                                        |
|-----|----------------------------------------|
| az  | degrees, orientation angle, from North |
| dip | degrees, dip of pole                   |

**Value**

list of x,y,z values

**Author(s)**

Jonathan M. Lees <jonathan.lees@unc.edu>

**Examples**

```
v1 = mc2cart(65,32)
v2 = mc2cart(135,74)
```

---

mijsdr

*Moment Tensor to Strike-Dip-Rake*

---

**Description**

Convert a normalized moment tensor from the CMT catalog to Strike-Dip-Rake.

**Usage**

```
mijsdr(mxx, myy, mzz, mxy, mxz, myz)
```

**Arguments**

|     |                   |
|-----|-------------------|
| mxx | moment tensor 1,1 |
| myy | moment tensor 2,2 |
| mzz | moment tensor 3,3 |
| mxy | moment tensor 1,2 |
| mxz | moment tensor 1,3 |
| myz | moment tensor 2,3 |

**Details**

the coordinate system is modified to represent a system centered on the source.

**Value**

Focal Mechanism list

**Note**

This code will convert the output of the website, <http://www.globalcmt.org/CMTsearch.html> when dumped in the psmecha (GMT v>3.3) format.

---

MomentDist

*Distance Between Moment Tensors*

---

**Description**

Calculate the distance between moment tensors based on quaternions.

**Usage**

`MomentDist(E1, E2)`

**Arguments**

|    |               |
|----|---------------|
| E1 | Moment tensor |
| E2 | Moment tensor |

**Details**

Moment tensors should be right handed.

**Value**

angle in degrees

---

MRake

*Rake Calculation*

---

**Description**

Calculate various parameters associated with the Rake or Slip of an earthquake

**Usage**

```
MRake(M)
```

**Arguments**

M                      list(uaz, ud, vaz, vd, paz, pd, taz, td)

**Details**

This routine takes the four poles U, V, P, T, and returns a MEC structure. (uaz, ud ) = U pole azimuth and dip ( vaz, vd)= V pole azimuth and dip (paz, pd)= P pole azimuth and dip (taz, td)= T pole azimuth and dip

**Value**

returns a MEC structure

**Author(s)**

Jonathan M. Lees <jonathan.lees@unc.edu>

**See Also**

CONVERTSDR, GetRakeSense, GetRake

**Examples**

```
mc = CONVERTSDR(329, 8, 110 )
MEC = MRake(mc$M)
```

---

net

*EqualArea Stereonet*

---

**Description**

Plot Equal Area Stereo-Net. Lambert azimuthal Equal-Area (Schmidt) from Snyder p. 185-186

**Usage**

```
net(add = FALSE, col = gray(0.7), border = "black", lwd = 1, LIM = c(-1, -1, +1, +1))
```

**Arguments**

|        |                                    |
|--------|------------------------------------|
| add    | logical, TRUE=add to existing plot |
| col    | color of lines                     |
| border | color of outer rim of stereonet    |
| lwd    | linewidth of lines                 |
| LIM    | bounding area for a new plot       |

**Value**

Used for graphical side effects

**Author(s)**

Jonathan M. Lees <jonathan.lees@unc.edu>

**References**

Snyder, John P., 1987, Map Projections-a working manual, USGS-Professional Paper, 383p. pages 185-186

```

---

nipXY

*Fault-Slip vector plot*

---

**Description**

Plots a fault plane and the slip vector. Used for geographic representation of numerous focal spheres.

**Usage**

```
nipXY(MEC, x = x, y = y, focsiz=1, fcol = gray(0.9), nipcol = "black", cex = 0.4)
```

**Arguments**

|        |                                    |
|--------|------------------------------------|
| MEC    | MEC structure                      |
| x      | coordinate on plot                 |
| y      | coordinate on plot                 |
| focsiz | size in inches                     |
| fcol   | color for plotting                 |
| nipcol | color of slip point                |
| cex    | character expansion for slip point |

**Details**

Slip vector is the cross product of the poles to the fault plane and auxilliary planes.

**Value**

```

---

normal.fault

*Normal Fault Cartoon*

---

**Description**

Illustrate a normal fault using animation

**Usage**

```
normal.fault(ANG = (45), anim = seq(from = 0, to = 1, by = 0.1),
             KAPPA = 4, Light = c(45, 45))
```

**Arguments**

|       |                              |
|-------|------------------------------|
| ANG   | Angle of dip                 |
| anim  | animation vector             |
| KAPPA | Phong parameter for lighting |
| Light | lighting point               |

**Details**

Program will animate a normal fault for educational purposes. Animation must be stopped by halting execution.

**Value**

Graphical Side effects

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

strikeslip.fault, thrust.fault

pcirc(gcol = "green", border = "purple", ndiv = 36)
```

---

|          |                                              |
|----------|----------------------------------------------|
| pglyph3D | <i>Plot a 3D body on an existing graphic</i> |
|----------|----------------------------------------------|

---

**Description**

rotates a body in 3D and plots projection on existing plot

**Usage**

```
pglyph3D(aglyph, M = diag(1, nrow = 4), M2 = diag(1, nrow = 4),
          anorms = list(), zee = c(0, 0, 1), col = "white", border = "black")
```

**Arguments**

|        |                                                                         |
|--------|-------------------------------------------------------------------------|
| aglyph | glyph structure describing the vertices and normal vectors of a 3D body |
| M      | rotation matrix 1                                                       |
| M2     | rotation matrix 2                                                       |
| anorms | up vector                                                               |
| zee    | up vector                                                               |
| col    | coor of body                                                            |
| border | color of border                                                         |

**Details**

Hidden sides are removed and phong shading is introduced to create 3D effect.

The input consists of an object defined by a list structure, list(aglyph, anorm) where aglyph is list of 3D polygons (faces) and anorm are outward normals to these faces.

**Value**

Used for side effect on plots

**Note**

For unusual rotations or bizarre bodies, this routine may produce strange looking shapes.

**Author(s)**

Jonathan M. Lees <jonathan.lees@unc.edu>

### create the 3D object
len = .7
basethick=.05
headlip=.02
headlen=.3

#### create a 3D glyph structure
aglyph = Z3Darrow(len = len , basethick =basethick , headlen =headlen ,
headlip=headlip )

#### define the up vector
```

```

myzee = matrix(c(0,0,1, 1), nrow=1, ncol=4)

##### set rotation angles:
gamma =12
beta =39
alpha = 62

##### set up rotation matrix
R3 = ROTZ(gamma)

R2 = ROTY(beta)

R1 = ROTZ(alpha)

### create rotation matrix
M =      R1

M2 =      R1

plot(c(-1,1), c(-1,1))

pglyph3D(aglyph$aglyph, anorms=aglyph$anorm , M=M, M2=M2, zee=myzee ,
col=rgb(.7, 0,0) )

```

---

phong3D

*Phong shading for a 3D body*

---

## Description

Create phong shading for faces showing on the 3D block

## Usage

```

phong3D(aglyph, M = diag(1, nrow = 4), M2 = diag(1, nrow = 4),
        Light = c(45, 45), anorms = list(), zee = c(0, 0, 1),
        col = "white", border = "black")

```

## Arguments

|        |                                    |
|--------|------------------------------------|
| aglyph | 3-D body list of faces and normals |
| M      | Rotation Matrix                    |
| M2     | Viewing Matrix                     |
| Light  | light source direction             |
| anorms | normals to faces                   |

|        |                        |
|--------|------------------------|
| zee    | Up vector for Body     |
| col    | color for faces        |
| border | border color for sides |

### Details

Uses a standard phong shading model based on the dot product of the face normal vector and direction of incoming light.

### Value

Graphical Side effect

PKAM

*P and T-axes data from the Harvard CMT catalog*

---

## Description

P and T-axes and Locations of Harvard CMT catalog for the intersection of the Kamchataka and Aleutian arcs

## Usage

```
data(PKAM)
```

## Format

The format is: chr "PKAM"

## Details

The data is selected from the CMT catalog. Parameters are extracted from the standard web distribution. Format of the list of data save in PKAM is:

- Paz P-axis azimuth angle
- Pdip P-axis dip angle
- Taz T-axis azimuth angle
- Tdip T-axis dip angle

- h horizontal point to plot on ternary plot
- v vertical point to plot on ternary plot
- fcols colors, not used
- LATS Latitude
- LONS Longitude
- IFcol integer pointer to internal color
- yr year, not used
- JDHM Julian Day, hour, minute, not used
- JDHMS Julian Day, hour, minute, seconds

plotfoc(M)
```

---

plotmanyfoc

*Plot Many Focals*

---

### Description

Plot a long list of focal mechanisms

### Usage

```
plotmanyfoc(MEK, PROJ, focsiz = 0.5, foccol = NULL,
UP=TRUE, focstyle=1, PMAT = NULL, LEG = FALSE, DOBAR = FALSE)
```

### Arguments

|          |                                                                  |
|----------|------------------------------------------------------------------|
| MEK      | List of Focal Mechanisms, see details                            |
| PROJ     | Projection                                                       |
| focsiz   | focal size, inches                                               |
| foccol   | focal color                                                      |
| UP       | logical, UP=TRUE means plot upper hemisphere (DEFAULT=TRUE)      |
| focstyle | integer, 1=beach ball, 2=nipplot, 3=strike-slip, 4=P-T, 5=P, 6=T |
| PMAT     | Projection Matrix from persp                                     |
| LEG      | logical, TRUE= add focal legend for color codes                  |
| DOBAR    | add strike dip bar at epicenter                                  |

**Details**

Input MEK list contains

```
MEKS = list(lon=0, lat=0, str1=0, dip1=0, rake1=0, dep=0, name="", Elat=0, Elon=0)
```

|---------|-------------------------------|
| plotMEC | <i>Plot a Focal Mechanism</i> |
|---------|-------------------------------|

---

**Description**

Plot a Focal Mechanism

**Usage**

```
plotMEC(x, detail = 0, up = FALSE)
```

**Arguments**

|        |                                    |
|--------|------------------------------------|
| x      | Mechanism list                     |
| detail | level of detail                    |
| up     | logical, Upper or lower hemisphere |

**Value**

Side Effects

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**Examples**

```
mc = CONVERTSDR(65, 32, -34 )
plotMEC(mc, detail=2, up=FALSE)
```

---

|            |                                        |
|------------|----------------------------------------|
| PlotPlanes | <i>Plot Fault an Auxilliary Planes</i> |
|------------|----------------------------------------|

---

**Description**

Plot both fault and auxilliary planes

**Usage**

```
PlotPlanes(MEC, col1 = 1, col2 = 3)
```

**Arguments**

|      |                   |
|------|-------------------|
| MEC  | MEC structure     |
| col1 | color for plane 1 |
| col2 | color for plane 2 |

**Details**

Given MEC structure and focal mechanism plot both planes. This code adds to existing plot, so `net()` should be called.

**Value**

Graphical Side Effects

**Author(s)**

Jonathan M. Lees <jonathan.lees@unc.edu>

**See Also**

`net`, `lowplane`

**Examples**

```
net()

MFOC1 = SDRfoc(65,25,13, u=FALSE, ALIM=c(-1,-1, +1, +1), PLOT=FALSE)
PlotPlanes(MFOC1, 'green', 'red' )
```

---

PlotPTsmooth

---

*Plot Smooth PT-axes*

---

**Description**

Project PT axes on the sphere and smooth the image. This function requires function `kde2d`, from the MASS library.

**Usage**

```
PlotPTsmooth(paz, pdip, x = 0, y = 0, siz = 1, bcol = "white", border = "black",
  IMAGE = TRUE, CONT = TRUE, cont.col = "black",
  pal = terrain.colors(100), LABS = FALSE, add = FALSE, NCP=50, NIP=200)
```

**Arguments**

|          |                                                                                |
|----------|--------------------------------------------------------------------------------|
| paz      | vector of Axis azimuths, degrees                                               |
| pdip     | vector of dip angles, degrees                                                  |
| x        | x-location of plot center in user coordinates                                  |
| y        | y-location of plot center in user coordinates                                  |
| siz      | siz of plot in user coordinates                                                |
| bcol     | color                                                                          |
| border   | border color                                                                   |
| IMAGE    | logical, TRUE=create an image plot                                             |
| CONT     | logical, TRUE=add contour lines                                                |
| cont.col | color of contour lines                                                         |
| pal      | pallette for image plot                                                        |
| LABS     | text Label for image                                                           |
| add      | logical, TRUE=add to plot                                                      |
| NCP      | integer, Number of points to use for calculating smoothed contours, default=50 |
| NIP      | integer, Number of points to use for calculating smoothed image, default=200   |

**Details**

Program requires MASS library for 2D smoothing routine kde2d.

For calculating contours the kde2d program creates a smoothed 2D image using NCP points per side. For the images, NIP points are used. To reduce the size of plots, or, if the subplots are very small, reduce NIP to a smaller value for faster plotting.

**Value**

Graphical Side Effect

**Note**

Points that fall on the opposite hemisphere are reflected through the origin.

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**See Also**

kde2d

**Examples**

```

plot(c(-1,1), c(-1,1), asp=1, type='n')

paz = rnorm(100, mean=297, sd=10)
pdip = rnorm(100, mean=52, sd=8)

PlotPTsmooth(paz, pdip, x=0.5, y=.5, siz=.3, border=NA, bcol='white' ,
LABS=FALSE, add=FALSE, IMAGE=TRUE, CONT=FALSE)

taz = rnorm(100, mean=138, sd=10)
tdip = rnorm(100, mean=12, sd=8)

PlotPTsmooth(taz, tdip, x=-.5, y=.4, siz=.3, border=NA, bcol='white' ,
LABS=FALSE, add=FALSE, IMAGE=TRUE, CONT=TRUE)

##### put them together
plot(c(-1,1), c(-1,1), asp=1, type='n')
PlotPTsmooth(paz, pdip, x=0, y=, siz=1, border=NA, bcol='white' ,
LABS=FALSE, add=FALSE, IMAGE=TRUE, CONT=FALSE)
PlotPTsmooth(taz, tdip, x=0, y=, siz=1, border=NA, bcol='white' ,
LABS=FALSE, add=TRUE, IMAGE=FALSE, CONT=TRUE)

```

---

PlotTernfoc

*Ternary Distribution of focal mechanisms*

---

**Description**

Create and plot a ternary diagram using rake angle to distribute focal mechanisms on a ternary diagram.

**Usage**

```
PlotTernfoc(h, v, x = 0, y = 0, siz = 1, fcols = "black", LABS = FALSE, add = FALSE)
```

**Arguments**

|       |                                                       |
|-------|-------------------------------------------------------|
| h     | x-coordinate on ternary plot                          |
| v     | y-coordinate of ternary plot                          |
| x     | x Location of center of Ternary plot                  |
| y     | y Location of center of Ternary plot                  |
| siz   | size of plot in user coordinates                      |
| fcols | vector of colors associated with each focal mechanism |
| LABS  | logical, TRUE=add labels at vertices of Ternary plot  |
| add   | logical, add to plot=TRUE                             |

**Value**

Used for graphical side effect.

PLTcirt

---

*Circle Plot with Cross Hairs*

---

## Description

Plot an arc of a circle with cross-hairs.

## Usage

```

PLTcirt(gcol = "black", border = "black", ndiv = 36,
  ang = c(-pi, pi), PLOT = TRUE, add = FALSE)

```

## Arguments

|        |                                         |
|--------|-----------------------------------------|
| gcol   | cross hairs color                       |
| border | border color                            |
| ndiv   | number of divisions                     |
| ang    | vector from ang[1] to ang[2] in radians |
| PLOT   | logical, if TRUE plot                   |
| add    | logical, if TRUE add to existing plot   |

## Value

list used for plotting:

|     |                 |
|-----|-----------------|
| x   | x coordinates   |
| y   | y coordinates   |
| phi | angles, radians |

**Author(s)**

 prepFOCS

*Prepare Focals*

---

**Description**

Prepare Focals for plotting. Program cycles through data and prepares a relevant data for further plotting and analysis.

**Usage**

```
prepFOCS(CMTSOL)
```

**Arguments**

CMTSOL            see getCMT for the format for the input here.

**Details**

Used internally in spherefocgeo and ternfocgeo.

**Value**

List:

|       |                                     |
|-------|-------------------------------------|
| Paz   | P-axis azimuth                      |
| Pdip  | P-axis dip                          |
| Taz   | T-axis azimuth                      |
| Tdip  | T-axis dip                          |
| h     | horizontal distance on ternary plot |
| v     | vertical distance on ternary plot   |
| fcols | focal color                         |
| LATS  | latitudes                           |
| LONS  | longitudes                          |

Side Effects

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**Examples**

```
mc = CONVERTSDR(65, 32, -34 )  
  
printMEC(mc)
```

---

|        |                   |
|--------|-------------------|
| PROJ3D | <i>Project 3D</i> |
|--------|-------------------|

---

**Description**

Project a 3D body after rotation and translation

**Usage**

```
PROJ3D(aglyph, M = diag(1, nrow = 4), M2 = diag(1, nrow = 4),  
       anorms = list(), zee = c(0, 0, 1))
```

**Arguments**

|        |                      |
|--------|----------------------|
| aglyph | glyph structure      |
| M      | rotation matrix      |
| M2     | rotation matrix      |
| anorms | normals to structure |
| zee    | Up direction of body |

**Details**

This function takes a 3D body, rotates it and projects it for plotting. An example glyph is found in Z3Darrow.

**Value**

|                 |                                   |
|-----------------|-----------------------------------|
| Glyph structure |                                   |
| x, y, z         | coordinates of rotated body faces |
| xp              | rotated normal vectors            |
| zd              | depth mean value of each face     |

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

```

---

PTaxes

---

*Plot P-T axis on CLVD*

---

## Description

Plot P-T axis on CLVD

## Usage

```
PTaxes(strike, dip, rake)
```

## Arguments

|        |        |
|--------|--------|
| strike | strike |
| dip    | dip    |
| rake   | rake   |

## Details

Lower Hemisphere. Add PT axes on a moment tensor plot

## Value

Side effects

## Author(s)

Jonathan M. Lees<[jonathan.lees@unc.edu](mailto:jonathan.lees@unc.edu)>

## See Also

`doNonDouble`, `MapNonDouble`

## Examples

```
mo = list(n=1, m1=1.035675e+017, m2=-1.985852e+016,
m3=-6.198052e+014, m4=1.177936e+017, m5=-7.600627e+016, m6=-3.461405e+017)
moments = cbind(mo$n, mo$m1, mo$m2, mo$m3, mo$m4, mo$m5, mo$m6)
doNonDouble(moments)
```

PTXY2

*Plot P-T Axes***Description**

given a focal mechanism, add P-T lines to a plot

**Usage**

```
PTXY2(x = x, y = y, MEC, focsiz, pt = 0, ...)
```

**Arguments**

|        |                                                            |
|--------|------------------------------------------------------------|
| x      | x-location on plot                                         |
| y      | y-location on plot                                         |
| MEC    | Focal Mechanism list from SDRFOC                           |
| focsiz | size of mechanism, inches                                  |
| pt     | pt = 0(plot both), 1=only P axes, 2=only T axes, default=0 |
| ...    | graphical parameters                                       |

**Details**

This is a summary plot to be used instead of Beach Balls.

---

`qpoint`*Point on Stereonet*

---

**Description**

Plot a set of (azimuths, takeoff) angles on a stereonet.

**Usage**

```
qpoint(az, iang, col = 2, pch = 5, lab = "", POS = 4, UP = FALSE, PLOT = FALSE, cex = 1)
```

**Arguments**

|                   |                                    |
|-------------------|------------------------------------|
| <code>az</code>   | vector of azimuths, degrees        |
| <code>iang</code> | vector of incident angles, degrees |
| <code>col</code>  | color                              |
| <code>pch</code>  | plotting character                 |
| <code>lab</code>  | text labels                        |
| <code>POS</code>  | position for labels                |
| <code>UP</code>   | logical, TRUE=upper                |
| <code>PLOT</code> | logical, add to existing plot      |
| <code>cex</code>  | character expansion of labels      |

**Details**

The `iang` argument represents the takeoff angle, and is measured from the nadir (z-axis pointing down).

**Value**

```

---

radP

*Radiation pattern for P waves*

---

### Description

calculate the radiation patterns for P waves

### Usage

```
radP(del, phiS, lam, ichi, phi)
```

### Arguments

|      |                           |
|------|---------------------------|
| del  | degrees, angle            |
| phiS | degrees,angle             |
| lam  | degrees, angle            |
| ichi | degrees, take off angle   |
| phi  | degrees, take off azimuth |

### Details

Given a focal mechanism strike-dip-rake and a given incident angle (take-off angle) and azimuth, return the P amplitude

### Value

Amplitude of the P wave

### Author(s)

Jonathan M. Lees <jonathan.lees@unc.edu>

### References

K.~Aki and P.~G. Richards.*Quantitative seismology*. University Science Books, Sausalito, Calif., 2nd edition, 2002.

|------------|-----------------------------------|
| rakelegend | <i>Focal Legend based on rake</i> |
|------------|-----------------------------------|

---

### Description

Focal Legend based on rake

### Usage

```
rakelegend(corn="topright", pal=1)
```

### Arguments

|      |                                        |
|------|----------------------------------------|
| corn | position of legend, default="topright" |
| pal  | palette number, default=1              |

### Details

Colors are based on earlier publication of Geotouch program.

For pal = 1, colors are , DarkSeaGreen, cyan1, SkyBlue1, RoyalBlue, GreenYellow, orange, red.

### Value

Graphical Side Effects

### Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

### References

|---------|--------------------------------|
| readCMT | <i>Read Harvard CMT moment</i> |
|---------|--------------------------------|

---

**Description**

Read and plot a CMT solution copied from the Harvard CMT website.

**Usage**

```
readCMT(filename, PLOT=TRUE)
```

**Arguments**

|          |                                            |
|----------|--------------------------------------------|
| filename | character, file name                       |
| PLOT     | Logical, TRUE=plot mechanisms sequentially |

**Details**

Uses the standard output format.

**Value**

List of mechanisms and graphical Side effects. Each element in the list consists of a list including: FIRST, yr, mo, dom, hr, mi, sec, name, tshift, half, lat, lon, z, Mrr, Mtt, Mpp, Mrt, Mrp, Mtp. The FIRST element is simply a duplicate of the PDE solution card.

**Note**

Other formats are available.

```

---

RectDense

---

*Divide a region into rectangles based on density*

---

**Description**

Given a set of (x,y) points, partition the field into rectangles each containing a minimum number of points

**Usage**

```
RectDense(INx, INy, icut = 1, u = par("usr"), ndivs = 10)
```

**Arguments**

|       |                                     |
|-------|-------------------------------------|
| INx   | x-coordinates                       |
| INy   | y-coordinates                       |
| icut  | cut off for number of points        |
| u     | user coordinates                    |
| ndivs | number of divisions in x-coordinate |

**Details**

Based on the user coordinates as returned from `par('usr')`. Each rectangular region is tested for the number of points that fall within `icut` or greater.

**Value**

List:

|         |                                               |
|---------|-----------------------------------------------|
| icorns  | matrix of corners that passed test            |
| ilens   | vector,number of points in each icorns box    |
| ipass   | vector, index of the corners that passed icut |
| corners | matrix of all corners                         |
| lens    | vector,number of points for each box          |

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**Examples**

```
x = rnorm(100)
y = rnorm(100)

plot(x,y)
u = par('usr')
RI = RectDense(x, y, icut=3, u=u, ndivs=10)

rect(RI$icorns[,1],RI$icorns[,2],RI$icorns[,3],RI$icorns[,4], col=NA, border='blue')
```

---

REFLECT

*reflect pole*

---

**Description**

Reflect pole to lower hemisphere

**Usage**

REFLECT(A)

**Arguments**

A                      structure of azimuth and Dips in degrees

**Value**

list of:cartesian coordinates of reflected pole

|     |                  |
|-----|------------------|
| x   | x-coordinate     |
| y   | y-coordinate     |
| z   | z-coordinate     |
| az  | azimuth, degrees |
| dip | dip, degrees     |

**Author(s)**

Jonathan M. Lees <jonathan.lees@unc.edu>

**See Also**

Rotfocphi

---

*Rotate Focal Mechanism*

---

**Description**

Rotate Focal Mechanism into the vertical plane by a certain number of degrees

**Usage**

```
Rotfocphi(phi, urot, udip, vrot, vdip, az1, d1, az2, d2, prot, pdip, trot, tdip)
```

**Arguments**

|      |                            |
|------|----------------------------|
| phi  | degrees in plane to rotate |
| urot | U-vector azimuth           |
| udip | U-vector dip               |

|      |                        |
|------|------------------------|
| vrot | V-vector azimuth       |
| vdip | V-vector dip           |
| az1  | First plane - azimuth  |
| d1   | First plane - dip      |
| az2  | Second plane - azimuth |
| d2   | Second plane - dip     |
| prot | P-axis azimuth         |
| pdip | P-axis dip             |
| trot | T-axis azimuth         |
| tdip | T-axis dip             |

**Details**

Rotate the focal mech by phi degrees

**Value**

list:

|-------|------------------------|
| RotTP | <i>Rotate T-P axes</i> |
|-------|------------------------|

---

**Description**

Rotate T-P axes

**Usage**

RotTP(rotmat, strk1, dip1)

**Arguments**

|        |                         |
|--------|-------------------------|
| rotmat | rotation matrix, 3 by 3 |
| strk1  | strike angle            |
| dip1   | dip angle               |

## Details

These are used as functions auxially to rotateFoc.

## Value

list:

strk                      strike angle

dip                        dip angle

ROTX

*X-axis Rotation Matrix*

---

## Description

Matrix rotation about the X-axis

## Usage

```
ROTX(deg)
```

## Arguments

deg                      Angle in degrees

## Value

A 4 by 4 matrix for rotation and translation for 3-D transformation

## Author(s)

Jonathan M. Lees <jonathan.lees@unc.edu>

**References**

**Examples**

```
v = c(1,4,5)
A = ROTX(23)
vp = c(v, 1)
```

---

rotx3

*Rotate about the x axis*

---

**Description**

3x3 Rotation about the x axis

**Usage**

```
rotx3(deg)
```

**Arguments**

deg                      angle, degrees

**Details**

returns a 3 by 3 rotation matrix

**Value**

matrix, 3 by 3

**Author(s)**

Jonathan M. Lees <jonathan.lees@unc.edu>

SDRfoc

*Plot a Focal Mechanism from SDR***Description**

Given Strike-Dip-Rake plot a focal mechanism

**Usage**

```
SDRfoc(s, d, r, u = FALSE, ALIM = c(-1, -1, +1, +1), PLOT = TRUE)
```

**Arguments**

|      |                                |
|------|--------------------------------|
| s    | strike, degrees                |
| d    | dip, degrees                   |
| r    | rake, degrees                  |
| u    | logical, TRUE=upper hemisphere |
| ALIM | bounding box on plot           |
| PLOT | logical, TRUE=add to plot      |

**Details**

The ALIM vector allows one to zoom into portions of the focal mechanism for details when points are tightly clustered.

**Value**

MEC structure

**Note**

Basic MEC List Structure

|        |                                                          |
|--------|----------------------------------------------------------|
| az1    | azimuth angle plane 1, degrees                           |
| dip1   | dip angle plane 1, degrees                               |
| az2    | azimuth angle plane 2, degrees                           |
| dip2   | dip angle plane 2, degrees                               |
| dir    | 0,1 to determine which section of focal sphere is shaded |
| rake1  | rake angle plane 1, degrees                              |
| dipaz1 | dip azimuth angle plane 1, degrees                       |
| rake2  | rake angle plane 2, degrees                              |
| dipaz2 | dip azimuth angle plane 2, degrees                       |
| P      | pole list(az, dip) P-axis                                |
| T      | pole list(az, dip) T-axis                                |
| U      | pole list(az, dip) U-axis                                |
| V      | pole list(az, dip) V-axis                                |

|       |                                                          |
|-------|----------------------------------------------------------|
| F     | pole list(az, dip) F-axis                                |
| G     | pole list(az, dip) G-axis                                |
| sense | 0,1 to determine which section of focal sphere is shaded |
| M     | list of focal parameters used in some calculations       |
| UP    | logical, TRUE=upper hemisphere                           |
| icol  | index to suite of colors for focal mechanism             |
| ileg  | Kind of fault                                            |
| fcol  | color of focal mechanism                                 |
| CNVRG | Character, note on convergence of solution               |
| LIM   | vector plotting region (x1, y1, x2, y2)                  |

```

---

ShadowCLVD

---

*Plot CLVD focal mechanism*

---

**Description**

Plot non-double couple part of the focal mechanism provided in the moment tensor.

**Usage**

```
ShadowCLVD(m, PLOT = TRUE, col=rgb(1, .75, .75))
```

**Arguments**

|      |                                                       |
|------|-------------------------------------------------------|
| m    | moment tensor                                         |
| PLOT | logical, TRUE means plot                              |
| col  | color, either a single color, rgb, or a color palette |

**Details**

This code is meant to be used with `doNonDouble` or `MapNonDouble` functions for plotting the non-double couple components of the moment tensor. A color palette can be provided for some details of the radiation patterns, e.g. `col=rainbow(12)`.

**Value**

Side effects and image list

**Note**

Lower Hemisphere.

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

doNonDouble, MapNonDouble

**Examples**

```
##### moment tensor from Harvard CMT catalog
sponent = 26
ef = 1*10^(sponent)
Mrr = 2.375*ef
Mtt = -2.777*ef
Mpp = 0.403*ef
Mrt = 2.800*ef
Mrp = 1.190*ef
Mtp = -0.539*ef

##### convert to cartesian coordinates
Mzz=Mrr
Mxx= Mtt
Myy= Mpp
Mxz= Mrt
Myz= -Mrp
Mxy= -Mtp

m=matrix( c(Mxx,Mxy,Mxz,
            Mxy,Myy,Myz,
            Mxz,Myz,Mzz), ncol=3, byrow=TRUE)

Fi=seq(from=0, by=0.1, to=361)
### dev.new()
plot(cos(Fi*pi/180.0),sin(Fi*pi/180.0),type='l', asp=1 , ann=FALSE, axes=FALSE)

ShadowCLVD(m, col='red')
```

---

`SHradfoc`*Plot SH-wave radiation*

---

**Description**

Plot SH-wave radiation with information from the pickfile and waveform data

**Usage**

```
SHradfoc(A, MEC, GU, pscale, col)
```

**Arguments**

|        |                          |
|--------|--------------------------|
| A      | Pickfile structure       |
| MEC    | MEC structure            |
| GU     | Waveform Event Structure |
| pscale | logical (not used)       |
| col    | color palette            |

**Details**

Image plot of the SH radiation pattern

**Value**

Graphical Side effects

```

---

spherefocgeo

*SphereFocGeo*

---

## Description

Spherical Projections of PT axes distributed geographically.

## Usage

```

spherefocgeo(CMTSOL, PROJ = NULL, icut = 5,
ndivs = 10, bbox=c(0,1, 0, 1), PLOT = TRUE,
add = FALSE, RECT = FALSE, pal = terrain.colors(100))

```

## Arguments

|        |                                                                                                         |
|--------|---------------------------------------------------------------------------------------------------------|
| CMTSOL | see output of getCMT for list input                                                                     |
| PROJ   | Map projection                                                                                          |
| icut   | cut off for number of points in box, default=5                                                          |
| ndivs  | divisions of map area, default=10                                                                       |
| bbox   | bounding box for dividing the area, given as minX, maxX, minY, maxY; default=usr coordinates from par() |
| PLOT   | logical, default=TRUE                                                                                   |
| add    | logical, add to existing plot                                                                           |
| RECT   | logical, TRUE=plot rectangles                                                                           |
| pal    | palette fo rimages in each box                                                                          |

**Details**

Program divides the area into blocks, tests each one for minimum number per block and projects the P and T axes onto an equal area stereonet.

```

---

`spline.arrow`*Spline Arrow*

---

**Description**

Given a set of points, draw a spline and affix an arrow at the end.

**Usage**

```
spline.arrow(x, y = 0, kdiv = 20, arrow = 1,  
             length = 0.2, col = "black", thick = 0.01,  
             headlength = 0.2, headthick = 0.1, code = 2, ...)
```

**Arguments**

|                         |                                                       |
|-------------------------|-------------------------------------------------------|
| <code>x</code>          | vector, x-coordinates                                 |
| <code>y</code>          | vector, y-coordinates                                 |
| <code>kdiv</code>       | Number of divisions                                   |
| <code>arrow</code>      | style of arrow, 1=simple arrow, 2=fancy arrow         |
| <code>length</code>     | length of head                                        |
| <code>col</code>        | color of arrow                                        |
| <code>thick</code>      | thickness of arrow stem                               |
| <code>headlength</code> | length of arrow head                                  |
| <code>headthick</code>  | thickness of arrow head                               |
| <code>code</code>       | code, 1=arrow on end of spline, 3=arrow on beginning. |
| <code>...</code>        | graphical parameters for the line                     |

**Details**

Can use either simple arrows or fancy arrows.

**Value**

list of x,y coordinates of the spline and Graphical Side effects

```

StrikeDip

*Plot Strike Dip Lines***Description**

Given a focal mechanism, add Strike Dip lines to a plot.

**Usage**

```
StrikeDip(x = x, y = y, MEC, focsiz, addDIP = TRUE, ...)
```

**Arguments**

|        |                                                      |
|--------|------------------------------------------------------|
| x      | x-location on plot                                   |
| y      | y-location on plot                                   |
| MEC    | Focal Mechanism list from SDRFOC                     |
| focsiz | size of mechanism, inches                            |
| addDIP | Logical, TRUE = add dip line perpendicular to strike |
| ...    | graphical parameters                                 |

**Details**

This is a summary plot to be used instead of Beach Balls.

**Value**

Graphical Side Effects

---

ternfoc.point

*Plot Ternary Point*

---

**Description**

Add a point to a ternary plot

**Usage**

```
ternfoc.point(deltaB, deltaP, deltaT)
```

**Arguments**

|        |                |
|--------|----------------|
| deltaB | angle, degrees |
| deltaP | angle, degrees |
| deltaT | angle, degrees |

**Details**

Plot point on a Ternary diagram using Froelich's algorithm.

**Value**

List

|   |                         |
|---|-------------------------|
| h | vector of x coordinates |
| v | vector of y coordinates |

**Note**

Use Bfocvec(az1, dip1, az2, dip2) to get the deltaB angle.

az1 = Msdr$M$az1
dip1 = Msdr$M$d1
az2 = Msdr$M$az2
dip2 = Msdr$M$d2
BBB = Bfocvec(az1, dip1, az2, dip2)
V = ternfoc.point(BBB$Bdip, Msdr$M$pd, Msdr$M$td )
```

---

ternfocgeo

*Ternary Focals*

---

**Description**

Ternary plots of rake categories (strike-slip, normal, thrust) distributed geographically.

**Usage**

```
ternfocgeo(CMTSOL, PROJ = NULL, icut = 5, ndivs = 10,
  bbox=c(0,1, 0, 1), PLOT = TRUE, add = FALSE, RECT = FALSE)
```

**Arguments**

|        |                                                                                                         |
|--------|---------------------------------------------------------------------------------------------------------|
| CMTSOL | see output of getCMT for list input                                                                     |
| PROJ   | Map projection                                                                                          |
| icut   | cut off for number of points in box, default=5                                                          |
| ndivs  | divisions of map area, default=10                                                                       |
| bbox   | bounding box for dividing the area, given as minX, maxX, minY, maxY; default=usr coordinates from par() |
| PLOT   | logical, default=TRUE                                                                                   |
| add    | logical, add to existing plot                                                                           |
| RECT   | logical, TRUE=plot rectangles                                                                           |

**Details**

Program divides the area into blocks, tests each one for minimum number per block and plots a ternary plot for each block.

---

`testrightHAND`*Test Right Hand of tensor*

---

### Description

Test Right Hand of tensor

### Usage

```
testrightHAND(U)
```

### Arguments

U                      3 by 3 matrix

### Details

The function `eigen` does not always produce a right-handed eigenvector matrix. The code tests each cross product to see if it creates a right-hand system.

### Value

logical vector

### Author(s)

Jonathan M. Lees<[jonathan.lees@unc.edu](mailto:jonathan.lees@unc.edu)>

### See Also

`forcerighthand`

**Examples**

|              |                                         |
|--------------|-----------------------------------------|
| TOSPHERE.DIP | <i>convert to spherical coordinates</i> |
|--------------|-----------------------------------------|

---

**Description**

convert to spherical coordinates

**Usage**

TOSPHERE.DIP(x, y, z)

**Arguments**

|   |              |
|---|--------------|
| x | x-coordinate |
| y | y-coordinate |
| z | z-coordinate |

**Details**

takes three components and returns azimuth and dip

**Value**

List

|     |                  |
|-----|------------------|
| az  | azimuth, degrees |
| dip | Dip, degrees     |
| x   | x-coordinate     |
| y   | y-coordinate     |
| z   | z-coordinate     |

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

|-----------|-----------------------------------------|
| tosphereL | <i>convert to spherical coordinates</i> |
|-----------|-----------------------------------------|

---

**Description**

convert to spherical coordinates

**Usage**

```
tosphereL(A)
```

**Arguments**

|   |              |
|---|--------------|
| A | list (x,y,z) |
|---|--------------|

**Details**

takes list of three components and returns azimuth and dip

**Value**

|      |                  |
|------|------------------|
| List |                  |
| az   | azimuth, degrees |
| dip  | Dip, degrees     |
| x    | x-coordinate     |
| y    | y-coordinate     |
| z    | z-coordinate     |

**Author(s)**

```

---

|        |                           |
|--------|---------------------------|
| TP2XYZ | <i>Trend - Dip to XYZ</i> |
|--------|---------------------------|

---

**Description**

Convert trend and dip to cartesian coordinates.

**Usage**

TP2XYZ(trend, dip)

**Arguments**

|       |                      |
|-------|----------------------|
| trend | trend angle, degrees |
| dip   | dip angle, degrees   |

**Details**

These are used as functions auxially to rotateFoc.

**Value**

vector: x, y, z

**Author(s)**

Jonathan M. Lees<jonathan.lees@unc.edu>

**Examples**

TP2XYZ(34, 40)

---

TRANmat

*Translation Matrix*

---

### Description

Create a 4 by 4 translation matrix

### Usage

TRANmat(x, y, z)

### Arguments

|   |               |
|---|---------------|
| x | x-translation |
| y | y-translation |
| z | z-translation |

### Value

Matrix suitable for translating a 3D body.

### Author(s)

Jonathan M. Lees <jonathan.lees@unc.edu>

### References

Rogers and Adams, 1990, Mathematical Elements for Computer Graphics, McGraw-Hill, 611p.

### See Also

---

**Wnet***Wulff Stereonet*

---

**Description**

plot a Wulff Stereonet (Equal-Angle)

**Usage**

```
Wnet(add = FALSE, col = gray(0.7), border = "black", lwd = 1)
```

**Arguments**

|        |                                    |
|--------|------------------------------------|
| add    | Logical, TRUE=add to existing plot |
| col    | color                              |
| border | border color                       |
| lwd    | line width                         |

**Details**

Plots equal-angle stereonet as opposed to equal-area.

**Value**

graphical side effects

**Author(s)**

Jonathan M. Lees <jonathan.lees@unc.edu>

**See Also**

net, pnet

**Examples**

```
Wnet()
```

---

**Wpoint***Plot points on Wulff Stereonet*

---

**Description**

Adds points to Wulff Equal-Angle Stereonet

**Usage**

```
Wpoint(az1, dip1, col = 2, pch = 5, lab = "", UP = FALSE)
```

**Arguments**

|      |                               |
|------|-------------------------------|
| az1  | azimuth angle, degrees        |
| dip1 | dip angle, degrees            |
| col  | color                         |
| pch  | plotting character            |
| lab  | label for point               |
| UP   | logical, TRUE=Upperhemisphere |

**Details**

Wulff net point is added to existing plot.

**Value**

graphical side effects

**Author(s)**

Jonathan M. Lees <jonathan.lees@unc.edu>

**See Also**

Wnet

**Examples**

```
Wnet()  
Wpoint(23, 34)
```

---

xsecmanyfoc

---

*Plot Focal Mechs at X-Y position on cross sections*

---

### Description

Plot Focal Mechs at X-Y positions on cross sections or other plots that do not have geographic coordinates and projection.

### Usage

```
xsecmanyfoc(MEK, theta=NULL, focsiz = 0.5,
  foccol = NULL, UP=TRUE, focstyle=1, LEG = FALSE, DOBAR = FALSE)
```

### Arguments

|          |                                                             |
|----------|-------------------------------------------------------------|
| MEK      | List of Focal Mechanisms, see details                       |
| focsiz   | focal size, inches                                          |
| theta    | degrees, angle from north for projecting the focal mechs    |
| foccol   | focal color, default is to calculate based on rake          |
| UP       | logical, UP=TRUE means plot upper hemisphere (DEFAULT=TRUE) |
| focstyle | integer, 1=beach ball, 2=nipplot                            |
| LEG      | logical, TRUE= add focal legend for color codes             |
| DOBAR    | add strike dip bar at epicenter                             |

### Details

Input MEK list contains

```
MEKS = list(lon=0, lat=0, str1=0, dip1=0, rake1=0, dep=0, name="", Elat=0, Elon=0, x=0, y=0)
```

The x, y coordinates of the input list are location where the focals will be plotted. For cross sections x=distance along the section and y would be depth. The focal mechs are added to the current plot.

### Value

Graphical Side Effects

### Note

If theta is NULL focals are plotted as if they were on a plan view. If theta is provided, however, the mechs are plotted with view from the vertical cross section. The cross section is taken at two points. Theta should be determined by viewing the cross section with the first point on the left and the second on the right. The view angle is through the section measured in degrees from north.

```

---

Z3Darrow

---

*Make a 3D arrow*

---

## Description

Create the list structure for a 3D arrow.

## Usage

```
Z3Darrow(len = 1, basethick = 0.1, headlen = 0.6, headlip = 0.1)
```

## Arguments

|           |                            |
|-----------|----------------------------|
| len       | Length in user coordinates |
| basethick | Thickness of the base      |
| headlen   | Length of the head         |
| headlip   | Width of the overhang lip  |

## Details

Creates a strucutre suitable for plotting rotated and translated 3D arrows.

## Value

|        |                                        |
|--------|----------------------------------------|
| List   |                                        |
| aglyph | List of vertices of the faces          |
| anorm  | Outward facing normal vectors to faces |
