

# Package ‘googleAnalyticsR’

December 21, 2018

**Type** Package

**Version** 0.6.0

**Title** Google Analytics API into R

**Description** Interact with the Google Analytics

APIs <<https://developers.google.com/analytics/>>, including the Core Reporting API (v3 and v4), Management API, and Multi-Channel Funnel API.

**URL** <http://code.markedmondson.me/googleAnalyticsR/>

**BugReports** <https://github.com/MarkEdmondson1234/googleAnalyticsR/issues>

**Depends** R (>= 3.2.0)

**Imports** assertthat (>= 0.2.0), dplyr (>= 0.7.0), googleAuthR (>= 0.6.2), httr (>= 1.3.1), jsonlite (>= 1.5), magrittr (>= 1.5), memoise, methods, purrr (>= 0.2.2), rlang (>= 0.1.0), tidyr (>= 0.6.3), utils

**Suggests** bigQueryR (>= 0.3.1), covr, googleCloudStorageR (>= 0.2.0), httpptest, knitr, miniUI (>= 0.1.1), rmarkdown, shiny (>= 0.13.2)

**License** MIT + file LICENSE

**LazyData** TRUE

**VignetteBuilder** knitr

**RoxygenNote** 6.0.1

**NeedsCompilation** no

**Author** Mark Edmondson [aut, cre] (<<https://orcid.org/0000-0002-8434-3881>>), Artem Klevtsov [ctb], Johann deBoer [ctb], David Watkins [ctb], Olivia Brode-Roger [ctb], Jas Sohi [ctb], Zoran Selinger [ctb]

**Maintainer** Mark Edmondson <[m@sunholo.com](mailto:m@sunholo.com)>

**Repository** CRAN

**Date/Publication** 2018-12-21 14:50:10 UTC

**R topics documented:**

aggregateGAData	<i>Aggregate a Google Analytics dataframe over inputted columns</i>
-----------------	---

---

## Description

A helper function to aggregate over dimensions

## Usage

```
aggregateGAData(ga_data, agg_names = NULL,
  mean_regex = "^avg|^percent|Rate$|^CPC$|^CTR$|^CPM$|^RPC$|^ROI$|^ROAS$|Per$")
```

**Arguments**

ga_data	A dataframe of data to aggregate
agg_names	The columns to aggregate over
mean_regex	The regex for column names to do mean() rather than sum()

**Details**

Will auto select metrics if they are numeric class columns. Will auto perform mean aggregation if metric names match mean\_regex argument If agg\_names is NULL will aggregate over all

**Examples**

```
## Not run:

# use `aggregateGADData` so you can on the fly create summary data
ga_data <- google_analytics(81416156,
                             date_range = c("10daysAgo", "yesterday"),
                             metrics = "sessions", dimensions = c("hour","date"))

# if we want totals per hour over the dates:
aggregateGADData(ga_data[,c("hour","sessions")], agg_names = "hour")

# it knows not to sum metrics that are rates:
aggregateGADData(ga_data[,c("hour","bounceRate")], agg_names = "hour")

## End(Not run)
```

---

allowed\_metric\_dim     *Create named list of allowed GA metrics/dimensions*

---

**Description**

Create named list of allowed GA metrics/dimensions

**Usage**

```
allowed_metric_dim(type = c("METRIC", "DIMENSION"), subType = c("all",
  "segment", "cohort"), callAPI = FALSE)
```

**Arguments**

type	Type of parameter to create
subType	to restrict to only those in this type

callAPI This will update the meta table (Requires online authorization)  
 This is useful to expand goalXCompletions to all the possibilities, as well as restricting to those that variables that work with your API call.  
 Use internal meta table, but you have option to update to the latest version.

**Value**

A named list of parameters for use in API calls

---

authDropdown *authDropdown [Shiny Module]*

---

**Description**

Shiny Module for use with [authDropdownUI](#)

**Usage**

```
authDropdown(input, output, session, ga.table, viewIdOnly = TRUE)
```

**Arguments**

input	shiny input
output	shiny output
session	shiny session
ga.table	A table of GA tables
viewIdOnly	Default only returns the viewId, set to FALSE to return the row of ga.table satisfying the selections

**Details**

Call via `shiny::callModule(authDropdown, "your_id")`

**Value**

GA View Id selected

**See Also**

Other Shiny modules: [authDropdownUI](#), [multi\\_selectUI](#), [multi\\_select](#)

---

authDropdownUI	<i>authDropdown UI [Shiny Module]</i>
----------------	---------------------------------------

---

**Description**

Makes a dropdown row for use for authentication.

**Usage**

```
authDropdownUI(id, width = NULL, inColumns = FALSE)
```

**Arguments**

id	Shiny id.
width	The width of the input
inColumns	whether to wrap selectInputs in width=4 columns. Shiny Module for use with <a href="#">authDropdown</a> .

**Value**

Shiny UI

**See Also**

Other Shiny modules: [authDropdown](#), [multi\\_selectUI](#), [multi\\_select](#)

---

dim_filter	<i>Make a dimension filter object</i>
------------	---------------------------------------

---

**Description**

Make a dimension filter object

**Usage**

```
dim_filter(dimension, operator = c("REGEXP", "BEGINS_WITH", "ENDS_WITH",  
  "PARTIAL", "EXACT", "NUMERIC_EQUAL", "NUMERIC_GREATER_THAN",  
  "NUMERIC_LESS_THAN", "IN_LIST"), expressions, caseSensitive = FALSE,  
  not = FALSE)
```

**Arguments**

dimension	dimension name to filter on.
operator	How to match the dimension.
expressions	What to match. A character vector if operator is "IN_LIST"
caseSensitive	Boolean.
not	Logical NOT operator. Boolean.

**Value**

An object of class `dim_fil_ga4` for use in `filter_clause_ga4`

**See Also**

Other filter functions: `filter_clause_ga4`, `met_filter`

**Examples**

```
## Not run:
library(googleAnalyticsR)

## authenticate,
## or use the RStudio Addin "Google API Auth" with analytics scopes set
ga_auth()

## get your accounts
account_list <- google_analytics_account_list()

## pick a profile with data to query

ga_id <- account_list[23,'viewId']

## create filters on metrics
mf <- met_filter("bounces", "GREATER_THAN", 0)
mf2 <- met_filter("sessions", "GREATER", 2)

## create filters on dimensions
df <- dim_filter("source", "BEGINS_WITH", "1", not = TRUE)
df2 <- dim_filter("source", "BEGINS_WITH", "a", not = TRUE)

## construct filter objects
fc2 <- filter_clause_ga4(list(df, df2), operator = "AND")
fc <- filter_clause_ga4(list(mf, mf2), operator = "AND")

## make v4 request
ga_data1 <- google_analytics_4(ga_id,
                              date_range = c("2015-07-30", "2015-10-01"),
                              dimensions=c('source', 'medium'),
                              metrics = c('sessions', 'bounces'),
                              met_filters = fc,
```

```

dim_filters = fc2,
filtersExpression = "ga:source!=(direct)")

## End(Not run)

```

---

```
fetch_google_analytics_4
```

*Fetch multiple GAv4 requests*

---

### Description

Fetch the GAv4 requests as created by [make\\_ga\\_4\\_req](#)

### Usage

```
fetch_google_analytics_4(request_list, merge = FALSE,
  useResourceQuotas = NULL)
```

### Arguments

<code>request_list</code>	A list of requests created by <a href="#">make_ga_4_req</a>
<code>merge</code>	If TRUE then will rbind that list of data.frames
<code>useResourceQuotas</code>	If using GA360, access increased sampling limits. Default NULL, set to TRUE or FALSE if you have access to this feature.

### Details

For same viewId, daterange, segments, samplingLevel and cohortGroup, v4 batches can be made

### Value

A dataframe if one request, or a list of data.frames if multiple.

### See Also

Other GAv4 fetch functions: [fetch\\_google\\_analytics\\_4\\_slow](#), [google\\_analytics](#), [make\\_ga\\_4\\_req](#)

### Examples

```

## Not run:
library(googleAnalyticsR)

## authenticate,
## or use the RStudio Addin "Google API Auth" with analytics scopes set

```

```
ga_auth()

## get your accounts
account_list <- google_analytics_account_list()

## pick a profile with data to query

ga_id <- account_list[23, 'viewId']

ga_req1 <- make_ga_4_req(ga_id,
                        date_range = c("2015-07-30", "2015-10-01"),
                        dimensions=c('source', 'medium'),
                        metrics = c('sessions'))

ga_req2 <- make_ga_4_req(ga_id,
                        date_range = c("2015-07-30", "2015-10-01"),
                        dimensions=c('source', 'medium'),
                        metrics = c('users'))

fetch_google_analytics_4(list(ga_req1, ga_req2))

## End(Not run)
```

---

fetch\_google\_analytics\_4\_slow

*Fetch GAv4 requests one at a time*

---

## Description

Due to large complicated queries causing the v4 API to timeout, this option is added to fetch via the more traditional one report per request

## Usage

```
fetch_google_analytics_4_slow(request_list, max_rows, allRows = FALSE,
                              useResourceQuotas = NULL)
```

## Arguments

request_list	A list of requests created by <a href="#">make_ga_4_req</a>
max_rows	Number of rows requested (if not fetched)
allRows	Whether to fetch all available rows
useResourceQuotas	If using GA360, access increased sampling limits. Default NULL, set to TRUE or FALSE if you have access to this feature.

**Value**

A dataframe of all the requests

**See Also**

Other GAv4 fetch functions: [fetch\\_google\\_analytics\\_4](#), [google\\_analytics](#), [make\\_ga\\_4\\_req](#)

---

`filter_clause_ga4`      *Make a dimension or metric filter clause object*

---

**Description**

Make a dimension or metric filter clause object

**Usage**

```
filter_clause_ga4(filters, operator = c("OR", "AND"))
```

**Arguments**

`filters`            a list of [dim\\_filter](#) or [met\\_filter](#). Only one type allowed.  
`operator`           combination of filter.

**Details**

If you have dimension and metric filters, make the clauses in two separate calls, then pass the objects to [make\\_ga\\_4\\_req](#)

**Value**

An object of class `dim_fil_ga4` or `met_fil_ga4` for use in [make\\_ga\\_4\\_req](#)

**See Also**

Other filter functions: [dim\\_filter](#), [met\\_filter](#)

**Examples**

```
## Not run:  
library(googleAnalyticsR)  
  
## authenticate,  
## or use the RStudio Addin "Google API Auth" with analytics scopes set  
ga_auth()  
  
## get your accounts  
account_list <- google_analytics_account_list()
```

```

## pick a profile with data to query

ga_id <- account_list[23,'viewId']

## create filters on metrics
mf <- met_filter("bounces", "GREATER_THAN", 0)
mf2 <- met_filter("sessions", "GREATER", 2)

## create filters on dimensions
df <- dim_filter("source","BEGINS_WITH","1",not = TRUE)
df2 <- dim_filter("source","BEGINS_WITH","a",not = TRUE)

## construct filter objects
fc2 <- filter_clause_ga4(list(df, df2), operator = "AND")
fc <- filter_clause_ga4(list(mf, mf2), operator = "AND")

## make v4 request
ga_data1 <- google_analytics_4(ga_id,
                               date_range = c("2015-07-30","2015-10-01"),
                               dimensions=c('source','medium'),
                               metrics = c('sessions','bounces'),
                               met_filters = fc,
                               dim_filters = fc2,
                               filtersExpression = "ga:source!=(direct)")

## End(Not run)

```

---

ga\_accounts

*List account metadata*

---

## Description

This gets a list of account meta data, that can be used in other management API functions.

## Usage

```
ga_accounts()
```

## Details

This gets the meta data associated with the accounts you have access to with your user. If you want all information such as web properties and viewIds, use [ga\\_account\\_list](#) instead.

## Value

A data.frame with accountid, name, an R datetime object (POSIXct) when the account was created and last updated, and the effective permissions your user has for those accounts.

**See Also**

Other account structure functions: [ga\\_view\\_list](#), [ga\\_view](#), [ga\\_webproperty\\_list](#), [ga\\_webproperty](#), [google\\_analytics\\_account\\_list](#)

**Examples**

```
## Not run:  
  
library(googleAnalyticsR)  
ga_auth()  
ga_accounts()  
  
## End(Not run)
```

---

ga_adwords	<i>Get AdWords Link meta data</i>
------------	-----------------------------------

---

**Description**

Get AdWords Link meta data

**Usage**

```
ga_adwords(accountId, webPropertyId, webPropertyAdWordsLinkId)
```

**Arguments**

accountId	Account Id
webPropertyId	Web Property Id
webPropertyAdWordsLinkId	AdWords Link Id

**Value**

AdWords Meta data

**See Also**

Other managementAPI functions: [ga\\_adwords\\_list](#), [ga\\_clientid\\_hash](#), [ga\\_experiment\\_list](#), [ga\\_experiment](#), [ga\\_filter\\_add](#), [ga\\_filter\\_apply\\_to\\_view](#), [ga\\_filter\\_delete](#), [ga\\_filter\\_list](#), [ga\\_filter\\_update\\_filter\\_link](#), [ga\\_filter\\_update](#), [ga\\_filter\\_view\\_list](#), [ga\\_filter\\_view](#), [ga\\_filter](#), [ga\\_goal\\_add](#), [ga\\_goal\\_list](#), [ga\\_goal\\_update](#), [ga\\_goal](#), [ga\\_remarketing\\_estimate](#), [ga\\_remarketing\\_get](#), [ga\\_remarketing\\_list](#), [ga\\_segment\\_list](#), [ga\\_unsampled\\_list](#), [ga\\_unsampled](#)

---

ga_adwords_list	<i>List AdWords</i>
-----------------	---------------------

---

**Description**

List AdWords

**Usage**

```
ga_adwords_list(accountId, webPropertyId)
```

**Arguments**

accountId	Account Id
webPropertyId	Web Property Id

**Value**

AdWords Links

**See Also**

Other managementAPI functions: [ga\\_adwords](#), [ga\\_clientid\\_hash](#), [ga\\_experiment\\_list](#), [ga\\_experiment](#), [ga\\_filter\\_add](#), [ga\\_filter\\_apply\\_to\\_view](#), [ga\\_filter\\_delete](#), [ga\\_filter\\_list](#), [ga\\_filter\\_update\\_filter\\_link](#), [ga\\_filter\\_update](#), [ga\\_filter\\_view\\_list](#), [ga\\_filter\\_view](#), [ga\\_filter](#), [ga\\_goal\\_add](#), [ga\\_goal\\_list](#), [ga\\_goal\\_update](#), [ga\\_goal](#), [ga\\_remarketing\\_estimate](#), [ga\\_remarketing\\_get](#), [ga\\_remarketing\\_list](#), [ga\\_segment\\_list](#), [ga\\_unsampled\\_list](#), [ga\\_unsampled](#)

---

ga_auth	<i>Authenticate with Google Analytics OAuth2</i>
---------	--

---

**Description**

A wrapper for [gar\\_auth](#) and [gar\\_auth\\_service](#)

**Usage**

```
ga_auth(token = NULL, new_user = FALSE, no_auto = FALSE)
```

**Arguments**

token	An existing token or file location of a token to authenticate with
new_user	If TRUE, reauthenticate via Google login screen
no_auto	Skip auto authentication

**Details**

Run this function first time to authenticate with Google in your browser.

After initial authentication, a `.httr-oauth` will be saved to your working directory, where your authentication details are kept. Keep this file safe.

If you want to reauthenticate, delete this file from your directory or run `ga_auth(new_user = TRUE)`

**Value**

Invisibly, the token that has been saved to the session

**Multiple accounts**

You can authenticate with a new auth file for each account. Supply argument `token` with the name of the cache file you want to use e.g. `ga_auth(token = "one.httr-oauth")` for one account, `ga_auth(token = "another.httr-oauth")` for a different account.

**Auto-authentication**

You can choose to auto-authenticate by moving your `.httr-oauth` or by creating a Google OAuth service account JSON file.

Specify an environment variable in R via a `.Renviron` file or using `Sys.setenv` which point to the file location of your chosen authentication file. See [Startup](#)

Once you have set the environment variable `GA_AUTH_FILE` to a valid file location, the function will look there for authentication details upon loading the library meaning you will not need to call `ga_auth()` yourself as you would normally.

An example `.Renviron` file is below:

```
GA_AUTH_FILE = "/Users/bob/auth/googleAnalyticsR.httr-oauth"
```

`GA_AUTH_FILE` can be either a auth file for a token generated by [gar\\_auth](#) or service account JSON ending with file extension `.json`

**Your own Google Project**

By default the Google Project used is shared by all users, so you may find it runs out of API calls. To mitigate that, create your own Google Project and turn on the Analytics APIs.

You can then create your own client ID and client secret, to place in options or environment arguments (whichever is easiest)

The environment args are below. Similar to auto-authentication, you can place your entries in an `.Renviron` file

```
GA_CLIENT_ID="XXXX" GA_CLIENT_SECRET="XXX" GA_WEB_CLIENT_ID="XXX" GA_WEB_CLIENT_SECRET="XXX"
```

**Service accounts**

If you use the service account JSON, you will need to add the service account email to your Google Analytics users to see data e.g. `xxxx@yyyyyy.iam.gserviceaccount.com`

---

ga_cache_call	<i>Setup caching of API calls</i>
---------------	-----------------------------------

---

**Description**

Lets you cache API calls to disk

**Usage**

```
ga_cache_call(cache_location)
```

**Arguments**

cache\_location If RAM will save to memory, or specify a file folder location

**Details**

By default this is turned on upon package load to RAM. Should you want to cache calls to a folder then run this function to specify where.

---

ga_clientid_deletion	<i>Create or update a user deletion request</i>
----------------------	---

---

**Description**

The Google Analytics User Deletion API allows customers to process deletions of data associated with a given user identifier.

**Usage**

```
ga_clientid_deletion(userId, propertyId, idType = c("CLIENT_ID", "USER_ID",  
"APP_INSTANCE_ID"), propertyType = c("ga", "firebase"))
```

**Arguments**

userId	A character vector of user ID's
propertyId	The Google Analytics Web property or Firebase ProjectId you are deleting the user from.
idType	Type of user. One of APP_INSTANCE_ID, CLIENT_ID or USER_ID.
propertyType	Firebase or Google Analytics

## Details

The user explorer report in Google Analytics can give you the client.id you need to test.

A data deletion request can be applied to either a Google Analytics web property (specified by `propertyType="ga"`) or Firebase application (`propertyType="firebase"`). A user whose data will be deleted can be specified by setting one of the identifiers the `userId` field. The type of the identifier must be specified inside `idType` field.

There is a quota of 500 queries per day per cloud project.

The API returns a User Deletion Request Resource with `deletionRequestTime` field set. This field is the point in time up to which all user data will be deleted. This means that all user data for the specified user identifier and Google Analytics property or Firebase project will be deleted up to this date and time - if the user with the same identifier returns after this date/time, they will reappear in reporting.

## Value

a data.frame with a row for each userID you sent in, plus a column with its `deletionRequestTime`

## See Also

<https://developers.google.com/analytics/devguides/config/userdeletion/v3/>

## Examples

```
## Not run:

# make sure you are authenticated with user deletion scopes
options(googleAuthR.scopes.selected = "https://www.googleapis.com/auth/analytics.user.deletion")
ga_auth(new_user = TRUE)

# a vector of ids
ids <- c("1489547420.1526330722", "1138076389.1526568883")

# do the deletions
ga_clientid_deletion(ids, "UA-1234-2")
#           userId id_type property      deletionRequestTime
#1 1489547420.1526330722 CLIENT_ID UA-1234-2 2018-05-20T19:43:33.540Z
#2 1138076389.1526568883 CLIENT_ID UA-1234-2 2018-05-20T19:43:36.218Z

## End(Not run)
```

---

ga_clientid_hash	<i>Get hashed version of client id (also known as hashClientId, hashedClientId, or BigQuery's fullVisitorId)</i>
------------------	--

---

**Description**

Get hashed version of client id (also known as hashClientId, hashedClientId, or BigQuery's fullVisitorId)

**Usage**

```
ga_clientid_hash(webPropertyId, clientId)
```

**Arguments**

webPropertyId	Web Property Id
clientId	Client Id

**Value**

hashedClientId object list

**See Also**

ga_custom_datasource	<i>List Custom Data Sources</i>
----------------------	---------------------------------

---

**Description**

Get a list of custom data sources you have configured in Google Analytics web UI.

**Usage**

```
ga_custom_datasource(accountId, webPropertyId)
```

**Arguments**

accountId	Account Id
webPropertyId	Web Property Id

**Details**

You primarily need this to get the customDataSourceId for the uploads via [ga\\_custom\\_upload\\_file](#)

**Value**

Custom Data Source

**See Also**

Other custom datasource functions: [ga\\_custom\\_upload\\_file](#), [ga\\_custom\\_upload\\_list](#), [ga\\_custom\\_upload](#)

---

ga_custom_upload	<i>Custom Data Source Upload Status</i>
------------------	---

---

**Description**

Get the status of a custom upload

**Usage**

```
ga_custom_upload(accountId, webPropertyId, customDataSourceId, uploadId,
  upload_object)
```

**Arguments**

accountId	Account Id
webPropertyId	Web Property Id
customDataSourceId	Custom data source Id
uploadId	upload Id
upload_object	A custom upload Id object. Supply this or the other arguments.

**Details**

You can supply either upload\_object generated via function or [ga\\_custom\\_upload\\_file](#), or make an

**Value**

An object of class ga\_custom\_data\_source\_upload

**See Also**

Other custom datasource functions: [ga\\_custom\\_datasource](#), [ga\\_custom\\_upload\\_file](#), [ga\\_custom\\_upload\\_list](#)

## Examples

```
## Not run:

upload_me <- data.frame(
  medium = "shinyapps",
  source = "referral",
  adCost = 1,
  date = "20160801")

obj <- ga_custom_upload_file(47850439,
  "UA-4748043-2",
  "_jDsJHSFSU-uw038Bh8fUg",
  upload_me)

## obj will initially have status = PENDING
obj
==Google Analytics Custom Data Source Upload==
Custom Data Source ID:  _jDsJHSFSU-uw038Bh8fUg
Account ID:             47850439
Web Property Id:       UA-4748043-2
Upload ID:             7yHLAkeLSiK1zveVTiWzWA
Status:                PENDING

## Send obj to ga_custom_upload() to check and renew status
obj <- ga_custom_upload(upload_object = obj)
obj

==Google Analytics Custom Data Source Upload==
Custom Data Source ID:  _jDsJHSFSU-uw038Bh8fUg
Account ID:             47850439
Web Property Id:       UA-4748043-2
Upload ID:             7yHLAkeLSiK1zveVTiWzWA
Status:                COMPLETED

## End(Not run)
```

---

ga\_custom\_upload\_file *Upload data to Google Analytics*

---

## Description

Upload external data up to 1GB to Google Analytics via the management API.

## Usage

```
ga_custom_upload_file(accountId, webPropertyId, customDataSourceId, upload)
```

**Arguments**

accountId	Account Id
webPropertyId	Web Property Id
customDataSourceId	Custom data source Id
upload	An R data.frame or a file path location (character)

**Details**

You need to create a custom data source in the web UI first.

If you are uploading an R data frame, the function will prefix the column names with "ga:" for you if necessary.

After upload check the status by querying data sources using [ga\\_custom\\_upload](#) and examining the status field.

Currently only supports simple uploads (not resumable).

**Value**

An object of class `ga_custom_data_source_upload`

**See Also**

A guide for preparing the data is available: [from Google here](#).

Web Property Id:       UA-4748043-2
Upload ID:             7yHLAkeLSiK1zveVTiWzWA
Status:                COMPLETED

## End(Not run)
```

---

ga\_custom\_upload\_list *List Custom Data Source Uploads*

---

### **Description**

List Custom Data Source Uploads

### **Usage**

```
ga_custom_upload_list(accountId, webPropertyId, customDataSourceId)
```

### **Arguments**

accountId	Account Id
webPropertyId	Web Property Id
customDataSourceId	Custom data source Id

### **Value**

Custom Data Source Uploads List

### **See Also**

Other custom datasource functions: [ga\\_custom\\_datasource](#), [ga\\_custom\\_upload\\_file](#), [ga\\_custom\\_upload](#)

---

ga\_custom\_vars      *Get Custom Dimensions or Metrics*

---

**Description**

Get Custom Dimensions or Metrics

**Usage**

```
ga_custom_vars(accountId, webPropertyId, type = c("customMetrics",
"customDimensions"), customId)
```

**Arguments**

accountId	Account Id
webPropertyId	Web Property Id
type	A customMetric or customDimension
customId	The customMetricId or customDimensionId

**Value**

Custom Metric or Dimension meta data

**See Also**

Other custom variable functions: [ga\\_custom\\_vars\\_create](#), [ga\\_custom\\_vars\\_list](#), [ga\\_custom\\_vars\\_patch](#)

---

ga\_custom\_vars\_create      *Create a custom dimension*

---

**Description**

Create a dimension by specifying its attributes.

**Usage**

```
ga_custom_vars_create(name, index, accountId, webPropertyId, active,
scope = c("HIT", "SESSION", "USER", "PRODUCT"))
```

**Arguments**

name	Name of custom dimension
index	Index of custom dimension - integer between 1 and 20 (200 for GA360)
accountId	AccountId of the custom dimension
webPropertyId	WebPropertyId of the custom dimension
active	TRUE or FALSE if custom dimension is active or not
scope	Scope of custom dimension - one of "HIT", "SESSION", "USER", "PRODUCT"

**See Also**

Other custom variable functions: [ga\\_custom\\_vars\\_list](#), [ga\\_custom\\_vars\\_patch](#), [ga\\_custom\\_vars](#)

**Examples**

```
## Not run:
library(googleAnalyticsR)
ga_auth()

# create custom var
ga_custom_vars_create("my_custom_dim",
                      index = 15,
                      accountId = 54019251,
                      webPropertyId = "UA-54019251-4",
                      scope = "HIT",
                      active = FALSE)

# view custom dimension in list
ga_custom_vars_list(54019251, webPropertyId = "UA-54019251-4", type = "customDimensions")

## End(Not run)
```

---

ga\_custom\_vars\_list    *List Custom Dimensions or Metrics*

---

**Description**

List Custom Dimensions or Metrics

**Usage**

```
ga_custom_vars_list(accountId, webPropertyId, type = c("customDimensions",
"customMetrics"))
```

**Arguments**

accountId	Account Id
webPropertyId	Web Property Id
type	A customMetric or customDimension

**Details**

This function lists all the existing custom dimensions or metrics for the web property.

**Value**

Custom Metric or Dimension List

**See Also**

Other custom variable functions: [ga\\_custom\\_vars\\_create](#), [ga\\_custom\\_vars\\_patch](#), [ga\\_custom\\_vars](#)

**Examples**

```
## Not run:
library(googleAnalyticsR)
ga_auth()

ga_custom_vars_list(54019251, webPropertyId = "UA-54019251-4", type = "customDimensions")

ga_custom_vars_list(54019251, webPropertyId = "UA-54019251-4", type = "customMetrics")

## End(Not run)
```

---

ga\_custom\_vars\_patch *Modify a custom dimension*

---

**Description**

Modify existing custom dimensions

**Usage**

```
ga_custom_vars_patch(id, accountId, webPropertyId, name = NULL,
  active = NULL, scope = NULL, ignoreCustomDataSourceLinks = FALSE)
```

**Arguments**

id	The id of the custom dimension
accountId	AccountId of the custom dimension
webPropertyId	WebPropertyId of the custom dimension
name	Name of custom dimension
active	TRUE or FALSE if custom dimension is active or not
scope	Scope of custom dimension - one of "HIT", "SESSION", "USER", "PRODUCT"
ignoreCustomDataSourceLinks	Force the update and ignore any warnings related to the custom dimension being linked to a custom data source / data set.

---

ga_filter	<i>Get specific filter for account</i>
-----------	--

---

**Description**

Get specific filter for account

**Usage**

```
ga_filter(accountId, filterId)
```

**Arguments**

accountId	Account Id
filterId	Filter Id

**Value**

filter list

**See Also**

Other managementAPI functions: [ga\\_adwords\\_list](#), [ga\\_adwords](#), [ga\\_clientid\\_hash](#), [ga\\_experiment\\_list](#), [ga\\_experiment](#), [ga\\_filter\\_add](#), [ga\\_filter\\_apply\\_to\\_view](#), [ga\\_filter\\_delete](#), [ga\\_filter\\_list](#), [ga\\_filter\\_update\\_filter\\_link](#), [ga\\_filter\\_update](#), [ga\\_filter\\_view\\_list](#), [ga\\_filter\\_view](#), [ga\\_goal\\_add](#), [ga\\_goal\\_list](#), [ga\\_goal\\_update](#), [ga\\_goal](#), [ga\\_remarketing\\_estimate](#), [ga\\_remarketing\\_get](#), [ga\\_remarketing\\_list](#), [ga\\_segment\\_list](#), [ga\\_unsampled\\_list](#), [ga\\_unsampled](#)

---

ga_filter_add	<i>Create a new filter and add it to the view (optional).</i>
---------------	---

---

**Description**

Take a filter object and add and/or apply it so its live.

**Usage**

```
ga_filter_add(Filter, accountId, webPropertyId = NULL, viewId = NULL,
  linkFilter = FALSE)
```

**Arguments**

Filter	The Filter object to be added to the account or view. See examples.
accountId	Account Id of the account to add the Filter to
webPropertyId	Property Id of the property to add the Filter to
viewId	View Id of the view to add the Filter to
linkFilter	If TRUE will apply the Filter to the view. Needs propertyId and viewId to be set.

## Details

If you don't set linkFilter=TRUE then the filter will only be created but not applied. You will find it listed in the admin panel Account > All Filters. You can then use [ga\\_filter\\_apply\\_to\\_view](#) to apply later on.

## Value

The filterId created if linkFilter=FALSE or a Filter object if linkFilter=TRUE

## See Also

Other managementAPI functions: [ga\\_adwords\\_list](#), [ga\\_adwords](#), [ga\\_clientid\\_hash](#), [ga\\_experiment\\_list](#), [ga\\_experiment](#), [ga\\_filter\\_apply\\_to\\_view](#), [ga\\_filter\\_delete](#), [ga\\_filter\\_list](#), [ga\\_filter\\_update\\_filter\\_link](#), [ga\\_filter\\_update](#), [ga\\_filter\\_view\\_list](#), [ga\\_filter\\_view](#), [ga\\_filter](#), [ga\\_goal\\_add](#), [ga\\_goal\\_list](#), [ga\\_goal\\_update](#), [ga\\_goal](#), [ga\\_remarketing\\_estimate](#), [ga\\_remarketing\\_get](#), [ga\\_remarketing\\_list](#), [ga\\_segment\\_list](#), [ga\\_unsampled\\_list](#), [ga\\_unsampled](#)

## Examples

```
## Not run:
## Create a filter object for adding an IP exclusion:
Filter <- list(
  name = 'Exclude Internal Traffic',
  type = 'EXCLUDE',
  excludeDetails = list(
    field = 'GEO_IP_ADDRESS',
    matchType = 'EQUAL',
    expressionValue = '199.04.123.1',
    caseSensitive = 'False'
  )
)

# create and add the filter to the view specified
my_filter <- ga_filter_add(Filter,
  accountId = 12345,
  webPropertyId = "UA-12345-1",
  viewId = 654321,
  linkFilter = TRUE)

# only create the filter, don't apply it to any view - returns filterId for use later
my_filter <- ga_filter_add(Filter,
  accountId = 12345,
  linkFilter = FALSE)

## Other examples of filters you can create below:
## Create a filter object for making campaign medium lowercase
Filter <- list(
  name = 'Lowercase Campaign Medium',
  type = 'LOWERCASE',
```

```
        lowercaseDetails = list(
          field = 'CAMPAIGN_MEDIUM'
        )
      )

## Create a filter object to append hostname to URI
Filter <- list(
  name = 'Append hostname to URI',
  type = 'ADVANCED',
  advancedDetails = list(
    fieldA = 'PAGE_HOSTNAME',
    extractA = '(.*)',
    fieldARequired = 'True',
    fieldB = 'PAGE_REQUEST_URI',
    extractB = '(.*)',
    fieldBRequired = 'False',
    outputConstructor = '$A1$B1',
    outputToField = 'PAGE_REQUEST_URI',
    caseSensitive = 'False',
    overrideOutputField = 'True'
  )
)

## Create a filter object to add www hostname without it
Filter <- list(
  name = 'Search and Replace www',
  type = 'SEARCH_AND_REPLACE',
  searchAndReplaceDetails = list(
    field = 'PAGE_HOSTNAME',
    searchString = '^exampleUSA\\.com$',
    replaceString = 'www.exampleUSA.com',
    caseSensitive = 'False'
  )
)

## End(Not run)
```

---

ga\_filter\_apply\_to\_view

*Apply an existing filter to view.*

---

### **Description**

Apply an existing filter to view.

### **Usage**

```
ga_filter_apply_to_view(filterId, accountId, webPropertyId, viewId)
```

**Arguments**

filterId	The id of the filter to be added to profile/view
accountId	Account Id of the account that contains the filter
webPropertyId	Web property Id to create profile filter link for
viewId	Profile/view Id to create profile filter link for

**Value**

A profileFilterLink object

**See Also**

Other managementAPI functions: [ga\\_adwords\\_list](#), [ga\\_adwords](#), [ga\\_clientid\\_hash](#), [ga\\_experiment\\_list](#), [ga\\_experiment](#), [ga\\_filter\\_add](#), [ga\\_filter\\_delete](#), [ga\\_filter\\_list](#), [ga\\_filter\\_update\\_filter\\_link](#), [ga\\_filter\\_update](#), [ga\\_filter\\_view\\_list](#), [ga\\_filter\\_view](#), [ga\\_filter](#), [ga\\_goal\\_add](#), [ga\\_goal\\_list](#), [ga\\_goal\\_update](#), [ga\\_goal](#), [ga\\_remarketing\\_estimate](#), [ga\\_remarketing\\_get](#), [ga\\_remarketing\\_list](#), [ga\\_segment\\_list](#), [ga\\_unsampled\\_list](#), [ga\\_unsampled](#)

---

ga_filter_delete	<i>Delete a filter from account or remove from view.</i>
------------------	--

---

**Description**

Delete a filter from account or remove from view.

**Usage**

```
ga_filter_delete(accountId, webPropertyId = NULL, viewId = NULL, filterId,
  removeFromView = FALSE)
```

**Arguments**

accountId	Account Id of the account that contains the filter
webPropertyId	Property Id of the property that contains the filter
viewId	View Id of the view that contains the filter
filterId	Filter Id of the filter to be deleted
removeFromView	Default if FALSE. If TRUE, deletes the filter from the view

**Value**

TRUE if successful

**See Also**

# using PATCH semantics, only need to construct what you want to change
filter_to_update <- list(name = test_name)

# update the filter using the filterId
ga_filter_update(filter_to_update, accountId2, filterId, method = "PATCH")
```

```
## End(Not run)
```

---

```
ga_filter_update_filter_link
```

*Update an existing profile filter link. Patch semantics supported*

---

## Description

Update an existing profile filter link. Patch semantics supported

## Usage

```
ga_filter_update_filter_link(viewFilterLink, accountId, webPropertyId, viewId,
  linkId, method = c("PUT", "PATCH"))
```

## Arguments

viewFilterLink	The profileFilterLink object
accountId	Account Id of the account that contains the filter
webPropertyId	Web property Id to which the profile filter link belongs
viewId	View Id to which the profile filter link belongs
linkId	The id of the profile filter link to be updated
method	PUT by default. Supports patch semantics when set to PATCH

**Examples**

```
## Not run:

## Create a Goal object based on destination:
Goal <- list(
  id = '17',
  active = TRUE,
  name = 'Checkout',
  type = 'URL_DESTINATION',
  urlDestinationDetails = list(
    url = '\\checkout\\thank_you',
    matchType = 'REGEX',
    caseSensitive = FALSE,
    firstStepRequired = FALSE,
    steps = list(
      list(
        number = 1,
        name = 'Product',
        url = '\\products\\'
      ),
      list(
        number = 2,
        name = 'Cart',
        url = '\\cart'
      ),
      list(
        number = 3,
        name = 'Contact',
        url = '\\checkout\\contact_information'
```

```

    ),
    list(
      number = 4,
      name = 'Shipping',
      url = '\\checkout\\shipping'
    ),
    list(
      number = 5,
      name = 'Payment',
      url = '\\checkout\\payment'
    ),
    list(
      number = 6,
      name = 'Processing',
      url = '\\checkout\\processing'
    )
  )
)
)
)
)

```

## Create a Goal object based on an event:

```

Goal <- list(
  id = '9',
  active = TRUE,
  name = 'PDF Download',
  type = 'EVENT',
  eventDetails = list(
    useEventValue = TRUE,
    eventConditions = list(
      list(
        type = 'CATEGORY',
        matchType = 'EXACT',
        expression = 'PDF Download'
      ),
      list(
        type = 'LABEL',
        matchType = 'EXACT',
        expression = 'January brochure'
      )
    )
  )
)
)
)
)

```

## Create a Goal object based on a number of pages visited in a session:

```

Goal <- list(
  id = '10',
  active = TRUE,
  name = 'Visited more than 3 pages',
  type = 'VISIT_NUM_PAGES',
  visitNumPagesDetails = list(
    comparisonType = 'GREATER_THAN',
    comparisonValue = 3
  )
)
)

```

```
)

## Create a Goal object based on the number of seconds spent on the site
Goal <- list(
  id = '11',
  active = TRUE,
  name = 'Stayed for more than 2 minutes',
  type = 'VISIT_TIME_ON_SITE',
  visitTimeOnSiteDetails = list(
    comparisonType = 'GREATER_THAN',
    comparisonValue = 120
  )
)

## End(Not run)
```

---

ga\_goal\_list

*List goals*

---

## Description

List goals

## Usage

```
ga_goal_list(accountId, webPropertyId, profileId)
```

## Arguments

accountId	Account Id
webPropertyId	Web Property Id
profileId	Profile Id

## Value

Goal list

## See Also

ga_goal_update	<i>Updates an existing goal.</i>
----------------	----------------------------------

---

**Description**

Updates an existing goal.

**Usage**

```
ga_goal_update(Goal, accountId, webPropertyId, viewId, goalId,
  method = c("PUT", "PATCH"))
```

**Arguments**

Goal	The Goal object to be updated See examples from ga_goal_add()
accountId	Account Id of the account in which to modify the Goal
webPropertyId	Property Id of the property in which to modify the Goal
viewId	View Id of the view in which to modify the Goal
goalId	The id of the goal to be modified
method	PUT by default. For patch semantics use PATCH

**Value**

A goalManagement object

```
## Not run:

# Change the goal 11 to visits over 3 minutes
Goal <- list(
  active = TRUE,
  name = 'Stayed for more than 3 minutes',
  type = 'VISIT_TIME_ON_SITE',
  visitTimeOnSiteDetails = list(
    comparisonType = 'GREATER_THAN',
    comparisonValue = 180
```

```

    )
  )
  ga_goal_update(Goal, accountId, propertyId, viewId, 11)

  # Change destination url for goal 17
  Goal <- list(
    urlDestinationDetails = list(
      url = '\\checkout\\success'
    )
  )

  # Only the fields we're changing required because we're using PATCH method
  ga_goal_update(Goal, accountId, propertyId, viewId, 17, method = "PATCH")

  ## End(Not run)

```

---

ga\_remarketing\_build *Create a remarketing audience for creation*

---

## Description

Create definitions to be used within [ga\\_remarketing\\_create](#)

## Usage

```
ga_remarketing_build(segment, membershipDurationDays = NULL,
  daysToLookBack = NULL, state_duration = c("TEMPORARY", "PERMANENT"))
```

## Arguments

segment	The definition of the segment (v3 syntax)
membershipDurationDays	Number of days (in the range 1 to 540) a user remains in the audience.
daysToLookBack	The look-back window lets you specify a time frame for evaluating the behavior that qualifies users for your audience.
state_duration	If to be used in a state based audience, whether to make the segment temporary or permanent.

## Details

The look-back window lets you specify a time frame for evaluating the behavior that qualifies users for your audience. For example, if your filters include users from Central Asia, and Transactions Greater than 2, and you set the look-back window to 14 days, then any user from Central Asia whose cumulative transactions exceed 2 during the last 14 days is added to the audience.

**Examples**

```
## Not run:
adword_list <- ga_adwords_list(123456, "UA-123456-1")

adword_link <- ga_adword(adword_list$id[[1]])

segment_list <- ga_segment_list()$items$definition

my_remarketing1 <- ga_remarketing_build(segment_list[[1]],
  state_duration = "TEMPORARY",
  membershipDurationDays = 90,
  daysToLookBack = 14)

my_remarketing2 <- ga_remarketing_build(segment_list[[2]],
  state_duration = "PERMANENT",
  membershipDurationDays = 7,
  daysToLookBack = 31)

# state based only can include exclusions
ga_remarketing_create(adwords_link = adword_link,
  include = my_remarketing1,
  exclude = my_remarketing2,
  audienceType = "STATE_BASED",
  name = "my_remarketing_seg1")

## End(Not run)
```

---

ga\_remarketing\_create *Create a new remarketing audience*

---

**Description**

Create a remarketing audiences built via [ga\\_remarketing\\_build](#)

**Usage**

```
ga_remarketing_create(adwordsLinkId, include, exclude = NULL,
  audienceType = c("SIMPLE", "STATE_BASED"), name = NULL)
```

**Arguments**

adwordsLinkId	The adwords link to add the remarketing audience to
include	A <code>ga4_remarketing_segment</code> object to include via <a href="#">ga_remarketing_build</a>
exclude	If <code>audienceType="STATE_BASED"</code> , a <code>ga4_remarketing_segment</code> object to exclude via <a href="#">ga_remarketing_build</a>
audienceType	SIMPLE or STATE_BASED
name	An optional name, if not supplied one will be generated

## Details

This builds and calls the API to create the remarketing audience based on the segments you have defined.

## Examples

```
## Not run:
adword_list <- ga_adwords_list(123456, "UA-123456-1")

adword_link <- ga_adword(adword_list$id[[1]])

segment_list <- ga_segment_list()$items$definition

my_remarketing1 <- ga_remarketing_build(segment_list[[1]],
  state_duration = "TEMPORARY",
  membershipDurationDays = 90,
  daysToLookBack = 14)

my_remarketing2 <- ga_remarketing_build(segment_list[[2]],
  state_duration = "PERMANENT",
  membershipDurationDays = 7,
  daysToLookBack = 31)

# state based only can include exclusions
ga_remarketing_create(adwords_link = adword_link,
  include = my_remarketing1,
  exclude = my_remarketing2,
  audienceType = "STATE_BASED",
  name = "my_remarketing_seg1")

## End(Not run)
```

---

ga\_remarketing\_estimate

*Estimate number of users added to the segment yesterday*

---

## Description

Estimate number of users added to the segment yesterday

## Usage

```
ga_remarketing_estimate(remarketingAudience)
```

**Arguments**

remarketingAudience

A remarketing audience object from [ga\\_remarketing\\_get](#)

Takes the segment definition from a remarketing audiences and runs it against the viewId to see current estimated users

The total audience size is this figure for every membershipDurationDay from yesterday

**Value**

data.frame

**See Also**

ga\_unsampled\_download *Download Unsampler Report from Google Drive*

---

**Description**

Download Unsampler Report from Google Drive

**Usage**

```
ga_unsampled_download(reportTitle, accountId, webPropertyId, profileId,  
  downloadFile = TRUE)
```

**Arguments**

reportTitle	Title of Unsampler Report (case-sensitive)
accountId	Account Id
webPropertyId	Web Property Id
profileId	Profile Id
downloadFile	Default TRUE, whether to download, if FALSE returns a dataframe instead

**Value**

file location if downloadFile is TRUE, else a data.frame of download

**Examples**

```
## Not run:  
  
# get data.frame of unsampler reports you have available  
unsampler_list <- ga_unsampler_list(accountId = "12345",  
  webPropertyId = "UA-12345-4",  
  profileId = "129371234")  
  
# loop through unsampler reports and download as a list of data.frames  
dl <- lapply(unsampler_list$title, ga_unsampler_download,  
  accountId = "12345",  
  webPropertyId = "UA-12345-4",  
  profileId = "129371234",  
  downloadFile = FALSE)
```

```
# inspect first data.frame
dl[[1]]

# download unsampled report to csv file
ga_unsampled_download("my_report_title",
                      accountId = "12345",
                      webPropertyId = "UA-12345-4",
                      profileId = "129371234")

## End(Not run)
```

---

`ga_unsampled_list`      *List Unsampled Reports*

---

## Description

List Unsampled Reports

## Usage

```
ga_unsampled_list(accountId, webPropertyId, profileId)
```

## Arguments

<code>accountId</code>	Account Id
<code>webPropertyId</code>	Web Property Id
<code>profileId</code>	Profile Id

## Value

Unsampled Reports List

## See Also

## Examples

```
## Not run:

# get data.frame of unsampled reports you have available
unsample_list <- ga_unsampled_list(accountId = "12345",
                                  webPropertyId = "UA-12345-4",
                                  profileId = "129371234")

# loop through unsampled reports and download as a list of data.frames
dl <- lapply(unsample_list$title, ga_unsampled_download,
            accountId = "12345",
            webPropertyId = "UA-12345-4",
            profileId = "129371234",
            downloadFile = FALSE)

# inspect first data.frame
dl[[1]]

# download unsampled report to csv file
ga_unsampled_download("my_report_title",
                      accountId = "12345",
                      webPropertyId = "UA-12345-4",
                      profileId = "129371234")

## End(Not run)
```

---

ga\_users\_add

*Create or update user access to Google Analytics*

---

## Description

If you supply more than one email, then batch processing will be applied. Batching has special rules that give you 30 operations for the cost of one API call against your quota. When batching you will only get a TRUE result on successful batch, but individual entries may have failed. Check via [ga\\_users\\_list](#) afterwards and try to add individual linkIds to get more descriptive error messages.

## Usage

```
ga_users_add(email, permissions, accountId, webPropertyId = NULL,
             viewId = NULL)
```

### Arguments

email	The email(s) of the user(s) to add. Has to have a Google account.
permissions	Which permissions to add as a vector - "MANAGE_USERS", "EDIT", "COLLABORATE", "READ_AND_ANALYZE"
accountId	Account Id
webPropertyId	Web Property Id - set to NULL to operate on account level only
viewId	viewId - set to NULL to operate on webProperty level only

### Value

TRUE if successful

### See Also

### Examples

```
## Not run:  
library(googleAnalyticsR)  
ga_auth()  
  
ga_users_add(c("the_email@company.com", "another_email@company.com"),  
            permissions = "EDIT", accountId = 47480439)  
  
## End(Not run)
```

---

ga_users_delete	<i>Delete all user access for an email</i>
-----------------	--

---

### Description

This is a wrapper around calls to [ga\\_users\\_list](#) and [ga\\_users\\_delete\\_linkid](#). If you want more fine-grained control look at those functions.

The user email is deleted from all web properties and views underneath the accountId you provide.

### Usage

```
ga_users_delete(email, accountId)
```

## Arguments

email	The email of the user to delete
accountId	The accountId that the user will be deleted from including all web properties and Views underneath.

## Details

This deletes a user via their email reference for all webproperties and views for the account given.

## See Also

Other User management functions: [ga\\_users\\_add](#), [ga\\_users\\_delete\\_linkid](#), [ga\\_users\\_list](#), [ga\\_users\\_update](#)

## Examples

```
## Not run:

library(googleAnalyticsR)
ga_auth()
ga_users_delete("brian@agency.com", 12345678)

# multiple emails
ga_users_delete(c("brian@agency.com", "bill@benland.com"), 1234567)

## End(Not run)
```

---

ga\_users\_delete\_linkid

*Delete users access from account, webproperty or view level*

---

## Description

The linkId is in the form of the accountId/webPropertyId/viewId colon separated from a link unique Id.

Delete user access by supplying the linkId for that user at the level they have been given access. It won't work to delete user links at account level if they have been assigned at web property or view level - you will need to get the linkId for that level instead. e.g. a user needs permissions.local to be non-NULL to be deleted at that level. The parameter check will do this check before deletion and throw an error if they can not be deleted. Set this to check=FALSE to suppress this behaviour.

If you supply more than one linkId, then batch processing will be applied. Batching has special rules that give you 30 operations for the cost of one API call against your quota. When batching you will only get a TRUE result on successful batch, but individual linkIds may have failed. Check via [ga\\_users\\_list](#) afterwards and try to delete individual linkIds to get more descriptive error messages.

## Usage

```
ga_users_delete_linkid(linkId, accountId, webPropertyId = NULL,  
  viewId = NULL, check = TRUE)
```

## Arguments

linkId	The linkId(s) that is available using <a href="#">ga_users_list</a> e.g. 47480439:104185380183364788718
accountId	Account Id
webPropertyId	Web Property Id - set to NULL to operate on account level only
viewId	viewId - set to NULL to operate on webProperty level only
check	If the default TRUE will check that the user has user access at the level you are trying to delete them from - if not will throw an error.

## Value

TRUE if the deletion is successful, an error if not.

## See Also

## Not run:  
  
library(googleAnalyticsR)  
ga_auth()  
  
# get the linkId for the user you want to delete  
ga_users_list(47480439, webPropertyId = "UA-47480439-2", viewId = 81416156)  
ga_users_delete_linkid("81416156:114834495587136933146",  
  accountId = 47480439,  
  webPropertyId = "UA-47480439-2",  
  viewId = 81416156)  
  
# check its gone  
ga_users_list(47480439, webPropertyId = "UA-47480439-2", viewId = 81416156)  
  
# can only delete at level user has access, the above deletion woud have failed if via:  
ga_users_delete_linkid("47480439:114834495587136933146", 47480439)  
  
## End(Not run)
```

---

ga_users_list	<i>List Users</i>
---------------	-------------------

---

**Description**

Get a list of Account level user links, or if you supply the webPropertyId or viewId it will show user links at that level

**Usage**

```
ga_users_list(accountId, webPropertyId = "~all", viewId = "~all")
```

**Arguments**

accountId	Account Id
webPropertyId	Web Property Id - set to NULL to operate on account level only
viewId	viewId - set to NULL to operate on webProperty level only

**Details**

Will list users on an account, webproperty or view level

**Value**

A data.frame of user entity links including the linkId, email and permissions

**See Also**

[Account User Links Google Documentation](#)

**Examples**

```
## Not run:

library(googleAnalyticsR)
ga_auth()
ga_users_list(47480439)
ga_users_list(47480439, webPropertyId = "UA-47480439-2")
ga_users_list(47480439, webPropertyId = "UA-47480439-2", viewId = 81416156)

# use NULL to only list linkids for that level
ga_users_list(47480439, webPropertyId = NULL, viewId = NULL)

## End(Not run)
```

---

ga_users_update	<i>Update a user access in Google Analytics</i>
-----------------	---

---

### Description

This is for altering existing user access.

### Usage

```
ga_users_update(linkId, update_object, accountId, webPropertyId = NULL,  
                viewId = NULL)
```

### Arguments

linkId	The linkId to update
update_object	A list that will be turned into JSON via <a href="#">toJSON</a> that represents the new configuration for this linkId
accountId	Account Id
webPropertyId	Web Property Id - set to NULL to operate on account level only
viewId	viewId - set to NULL to operate on webProperty level only

### Value

The new user object that has been altered.

### See Also

Other User management functions: [ga\\_users\\_add](#), [ga\\_users\\_delete\\_linkid](#), [ga\\_users\\_delete](#), [ga\\_users\\_list](#)

### Examples

```
## Not run:  
  
library(googleAnalyticsR)  
ga_auth()  
  
# the update to perform  
o <- list(permissions = list(local = list("EDIT")))  
  
ga_users_update("UA-123456-1:1111222233334444",  
                update_object = o,  
                accountId = 47480439,  
                webPropertyId = "UA-123456-1")
```

```
## End(Not run)
```

---

ga_view	<i>Get single View (Profile)</i>
---------	----------------------------------

---

## Description

Gets meta-data for a particular View/Profile

## Usage

```
ga_view(accountId, webPropertyId, profileId)
```

## Arguments

accountId	Account Id
webPropertyId	Web Property Id
profileId	Profile (View) Id

## Value

A list of the Views meta-data.

## See Also

Other account structure functions: [ga\\_accounts](#), [ga\\_view\\_list](#), [ga\\_webproperty\\_list](#), [ga\\_webproperty](#), [google\\_analytics\\_account\\_list](#)

## Examples

## Not run:  
  
library(googleAnalyticsR)  
ga_auth()  
ga_view(1058095, webPropertyId = "UA-1058095-1", profileId = 1855267)  
  
## End(Not run)
```

---

ga_view_list	<i>List View (Profile)</i>
--------------	----------------------------

---

### Description

This gets the meta data associated with the Google Analytics Views for a particular accountId and webPropertyId. If you want all viewId information for all accounts you have access to, use [ga\\_account\\_list](#) instead.

### Usage

```
ga_view_list(accountId, webPropertyId)
```

### Arguments

accountId	Account Id
webPropertyId	Web Property Id e.g. UA-12345-1

### Value

A data.frame of meta-data for the views

### See Also

Other account structure functions: [ga\\_accounts](#), [ga\\_view](#), [ga\\_webproperty\\_list](#), [ga\\_webproperty](#), [google\\_analytics\\_account\\_list](#)

### Examples

ga_auth()  
views <- ga_view_list(1058095, "UA-1058095-1")  
  
## End(Not run)
```

---

ga_webproperty	<i>Get a web property</i>
----------------	---------------------------

---

### Description

Gets metadata for one particular web property

### Usage

```
ga_webproperty(accountId, webPropertyId)
```

**Arguments**

accountId      Account Id  
webPropertyId      Web Property Id e.g. UA-12345-1

**Value**

webproperty

**See Also**

Other account structure functions: [ga\\_accounts](#), [ga\\_view\\_list](#), [ga\\_view](#), [ga\\_webproperty\\_list](#), [google\\_analytics\\_account\\_list](#)

**Examples**

```
## Not run:  
library(googleAnalyticsR)  
ga_auth()  
wp <- ga_webproperty(1058095, "UA-1058095-1")  
  
## End(Not run)
```

---

ga\_webproperty\_list      *List web properties*

---

**Description**

This gets the meta data for web properties associated with a particular accountId. If you want all information available to your user, use [ga\\_account\\_list](#) instead.

**Usage**

```
ga_webproperty_list(accountId)
```

**Arguments**

accountId      Account Id

**Value**

A data.frame of webproperty meta-data

**See Also**

Other account structure functions: [ga\\_accounts](#), [ga\\_view\\_list](#), [ga\\_view](#), [ga\\_webproperty](#), [google\\_analytics\\_account](#)

## Examples

```
## Not run:
library(googleAnalyticsR)
ga_auth()
aa <- ga_accounts()
wp <- ga_webproperty_list(aa$id[1])

## End(Not run)
```

---

googleAnalyticsR      *Library for getting Google Analytics data into R*

---

## Description

Follow the online documentation here: <https://code.markedmondson.me/googleAnalyticsR/>

## Details

You may wish to set the below environment arguments for easier authentication

```
GA_CLIENT_ID GA_CLIENT_SECRET GA_WEB_CLIENT_ID GA_WEB_CLIENT_SECRET GA_AUTH_FILE
```

---

google\_analytics      *Get Google Analytics v4 data*

---

## Description

Fetch Google Analytics data using the v4 API. For the v3 API use [google\\_analytics\\_3](#). See website help for lots of examples: [Google Analytics Reporting API v4 in R](#)

## Usage

```
google_analytics(viewId, date_range = NULL, metrics = NULL,
  dimensions = NULL, dim_filters = NULL, met_filters = NULL,
  filtersExpression = NULL, order = NULL, segments = NULL,
  pivots = NULL, cohorts = NULL, max = 1000,
  samplingLevel = c("DEFAULT", "SMALL", "LARGE"), metricFormat = NULL,
  histogramBuckets = NULL, anti_sample = FALSE,
  anti_sample_batches = "auto", slow_fetch = FALSE,
  useResourceQuotas = NULL, rows_per_call = 10000L)
```

```
google_analytics_4(...)
```

**Arguments**

viewId	viewId of data to get.
date_range	character or date vector of format c(start, end) or for two date ranges: c(start1,end1,start2,end2)
metrics	Metric to fetch. Supports calculated metrics.
dimensions	Dimensions to fetch.
dim_filters	A <a href="#">filter_clause_ga4</a> wrapping <a href="#">dim_filter</a>
met_filters	A <a href="#">filter_clause_ga4</a> wrapping <a href="#">met_filter</a>
filtersExpression	A v3 API style simple filter string. Not used with other filters.
order	An <a href="#">order_type</a> object
segments	List of segments as created by <a href="#">segment_ga4</a>
pivots	Pivots of the data as created by <a href="#">pivot_ga4</a>
cohorts	Cohorts created by <a href="#">make_cohort_group</a>
max	Maximum number of rows to fetch. Defaults at 1000. Use -1 to fetch all results. Ignored when anti_sample=TRUE.
samplingLevel	Sample level
metricFormat	If supplying calculated metrics, specify the metric type
histogramBuckets	For numeric dimensions such as hour, a list of buckets of data. See details in <a href="#">make_ga_4_req</a>
anti_sample	If TRUE will split up the call to avoid sampling.
anti_sample_batches	"auto" default, or set to number of days per batch. 1 = daily.
slow_fetch	For large, complicated API requests this bypasses some API hacks that may result in 500 errors. For smaller queries, leave this as FALSE for quicker data fetching.
useResourceQuotas	If using GA360, access increased sampling limits. Default NULL, set to TRUE or FALSE if you have access to this feature.
rows_per_call	Set how many rows are requested by the API per call, up to a maximum of 100000.
...	Arguments passed to <a href="#">google_analytics</a>

**Value**

A Google Analytics data.frame, with attributes showing row totals, sampling etc.

### Row requests

By default the API call will use v4 batching that splits requests into 5 separate calls of 10k rows each. This can go up to 100k, so this means up to 500k rows can be fetched per API call, however the API servers will fail with a 500 error if the query is too complicated as the processing time at Google's end gets too long. In this case, you may want to tweak the `rows_per_call` argument downwards, or fall back to using `slow_fetch = FALSE` which will send an API request one at a time. If fetching data via scheduled scripts this is recommended as the default.

### Anti-sampling

`anti_sample` being `TRUE` ignores `max` as the API call is split over days to mitigate the sampling session limit, in which case a row limit won't work. Take the top rows of the result yourself instead e.g. `head(ga_data_unsampled, 50300)`

`anti_sample` being `TRUE` will also set `samplingLevel='LARGE'` to minimise the number of calls.

### Resource Quotas

If you are on GA360 and have access to resource quotas, set the `useResourceQuotas=TRUE` and set the Google Cloud client ID to the project that has resource quotas activated, via [gar\\_set\\_client](#) or options.

### Caching

By default local caching is turned on for v4 API requests. This means that making the same request as one this session will read from memory and not make an API call. You can also set the cache to disk via the [gar\\_cache\\_setup](#) function. This can be useful when running RMarkdown reports using data. To empty the cache use [gar\\_cache\\_empty](#).

### See Also

Other GAv4 fetch functions: [fetch\\_google\\_analytics\\_4\\_slow](#), [fetch\\_google\\_analytics\\_4](#), [make\\_ga\\_4\\_req](#)

### Examples

```
## Not run:
library(googleAnalyticsR)

## authenticate, or use the RStudio Addin "Google API Auth" with analytics scopes set
ga_auth()

## get your accounts
account_list <- google_analytics_account_list()

## account_list will have a column called "viewId"
account_list$viewId
```

```
## View account_list and pick the viewId you want to extract data from
ga_id <- 123456

## simple query to test connection
google_analytics(ga_id,
                 date_range = c("2017-01-01", "2017-03-01"),
                 metrics = "sessions",
                 dimensions = "date")

## End(Not run)
```

---

google\_analytics\_3      *Get Google Analytics v3 data (formerly google\_analytics())*

---

## Description

Legacy v3 API, for more modern API use [google\\_analytics](#).

## Usage

```
google_analytics_3(id, start, end, metrics = c("sessions", "bounceRate"),
                  dimensions = NULL, sort = NULL, filters = NULL, segment = NULL,
                  samplingLevel = c("DEFAULT", "FASTER", "HIGHER_PRECISION", "WALK"),
                  max_results = 100, multi_account_batching = FALSE, type = c("ga",
                  "mcf"))
```

## Arguments

id	A character vector of View Ids to fetch from.
start	Start date in YYYY-MM-DD format.
end	End date in YYYY-MM-DD format.
metrics	A character vector of metrics. With or without ga: prefix.
dimensions	A character vector of dimensions. With or without ga: prefix.
sort	How to sort the results, in form 'ga:sessions,-ga:bounceRate'
filters	Filters for the result, in form 'ga:sessions>0;ga:pagePath=~blah'
segment	How to segment.
samplingLevel	Choose "WALK" to mitigate against sampling.
max_results	Default 100. If greater than 10,000 then will batch GA calls.
multi_account_batching	If TRUE then multiple id's are fetched together. Not compatible with samplingLevel="WALK" or max_results>10000
type	ga = Google Analytics v3; mcf = Multi-Channel Funels.

**Value**

For one id a data.frame of data, with meta-data in attributes. For multiple id's, a list of dataframes.

**See Also**

<https://developers.google.com/analytics/devguides/reporting/core/v3/>

**Examples**

```
## Not run:

library(googleAnalyticsR)

## Authenticate in Google OAuth2
## this also sets options
ga_auth()

## if you need to re-authenticate use ga_auth(new_user=TRUE)
## if you have your own Google Dev console project keys,
## then don't run ga_auth() as that will set to the defaults.
## instead put your options here, and run googleAuthR::gar_auth()

## get account info, including View Ids
account_list <- google_analytics_account_list()
ga_id <- account_list$viewId[1]

## End(Not run)

```

---

```
google_analytics_account_list
```

*Account summary for all accounts available to your user*

---

## Description

This is the recommended way to get all your account details for your user, including the web property and View IDs. The \$viewId column contains the ID you need for the data fetching functions such as [google\\_analytics](#).

## Usage

```
google_analytics_account_list()
```

```
ga_account_list()
```

## Details

Get a summary of all your accounts, web properties and views your authenticated user can see.

**Value**

a dataframe of all account, webproperty and view data

**See Also**

<https://developers.google.com/analytics/devguides/config/mgmt/v3/mgmtReference/management/accountSummaries/list>

**Examples**

```
## Not run:  
  
library(googleAnalyticsR)  
ga_auth()  
al <- ga_account_list()  
al$viewId  
  
## End(Not run)
```

---

google\_analytics\_bq    *Get Google Analytics 360 BigQuery data*

---

**Description**

Turn a google\_analytics style call into BigQuery SQL. Used with Google Analytics 360 BigQuery exports.

**Usage**

```
google_analytics_bq(projectId, datasetId, start = NULL, end = NULL,  
  metrics = NULL, dimensions = NULL, sort = NULL, filters = NULL,  
  max_results = 100, query = NULL, return_query_only = FALSE,  
  bucket = NULL, download_file = NULL)
```

**Arguments**

projectId	The Google project Id where the BigQuery exports sit
datasetId	DatasetId of GA export. This should match the GA View ID
start	start date
end	end date
metrics	metrics to query
dimensions	dimensions to query
sort	metric to sort by

filters	filter results
max_results	How many results to fetch
query	If query is non-NULL then it will use that and ignore above
return_query_only	Only return the constructed query, don't call BigQuery
bucket	if over 100000 results, specify a Google Cloud bucket to send data to
download_file	Where to save asynch files. If NULL saves to current working directory.

### Details

All data will be unsampled, and requests will cost money against your BigQuery quota.

Requires installation of bigQueryR and authentication under ga\_bq\_auth() or googleAuthR::gar\_auth() with BigQuery scope set. View your projectIds upon authentication via [bqr\\_list\\_projects](#)

No segments for now.

Goals are not specified in BQ exports, so you need to look at how you define them and replicate per view e.g. unique pageviews or unique events.

Custom dimensions can be specified as session or hit level, so ignoring the setting in GA interface.

You can get a sample Google Analytics dataset in bigquery by following the instructions here: <https://support.google.com/analytics/answer/3416091?hl=en>

### Value

data.frame of results

### See Also

<https://support.google.com/analytics/answer/4419694?hl=en> <https://support.google.com/analytics/answer/3437719?hl=en>

---

google\_analytics\_meta *Get current dimensions and metrics available in GA API.*

---

### Description

Get current dimensions and metrics available in GA API.

### Usage

```
google_analytics_meta()
```

### Value

dataframe of dimensions and metrics available to use

**See Also**

<https://developers.google.com/analytics/devguides/reporting/metadata/v3/reference/metadata/columns/list>

---

make_cohort_group	<i>Create a cohort group</i>
-------------------	------------------------------

---

**Description**

Create a cohort group

**Usage**

```
make_cohort_group(cohorts, lifetimeValue = FALSE, cohort_types = NULL)
```

**Arguments**

cohorts            A named list of start/end date pairs  
lifetimeValue    lifetimeValue TRUE or FALSE. Only works for webapps.  
cohort\_types     placeholder, does nothing as only FIRST\_VISIT\_DATE supported.

**Details**

Example: `list("cohort 1" = c("2015-08-01", "2015-08-01"), "cohort 2" = c("2015-07-01",`

**Value**

A cohortGroup object

**See Also**

[https://developers.google.com/analytics/devguides/reporting/core/v4/advanced#cohort\\_and\\_lifetime\\_value\\_ltv\\_dimensions\\_and\\_metrics](https://developers.google.com/analytics/devguides/reporting/core/v4/advanced#cohort_and_lifetime_value_ltv_dimensions_and_metrics)

Other v4 cohort functions: [cohortGroup](#), [cohort\\_dimension\\_check](#), [cohort\\_metric\\_check](#), [cohort](#)

**Examples**

```
## Not run:
library(googleAnalyticsR)

## authenticate,
## or use the RStudio Addin "Google API Auth" with analytics scopes set
ga_auth()

## get your accounts
```

```

account_list <- google_analytics_account_list()

## pick a profile with data to query

ga_id <- account_list[23,'viewId']

## first make a cohort group

cohort4 <- make_cohort_group(list("cohort 1" = c("2015-08-01", "2015-08-01"),
                                "cohort 2" = c("2015-07-01","2015-07-01")))

## then call cohort report. No date_range and must include metrics and dimensions
## from the cohort list
cohort_example <- google_analytics(ga_id,
                                   dimensions=c('cohort'),
                                   cohort = cohort4,
                                   metrics = c('cohortTotalUsers'))

## End(Not run)

```

---

make\_ga\_4\_req

*Make a Google Analytics v4 API fetch*

---

## Description

This function constructs the Google Analytics API v4 call to be called via [fetch\\_google\\_analytics\\_4](#)

## Usage

```

make_ga_4_req(viewId, date_range = NULL, metrics = NULL,
              dimensions = NULL, dim_filters = NULL, met_filters = NULL,
              filtersExpression = NULL, order = NULL, segments = NULL,
              pivots = NULL, cohorts = NULL, pageToken = 0, pageSize = 1000,
              samplingLevel = c("DEFAULT", "SMALL", "LARGE"), metricFormat = NULL,
              histogramBuckets = NULL)

```

## Arguments

viewId	viewId of data to get.
date_range	character or date vector of format c(start, end) or for two date ranges: c(start1,end1,start2,end2)
metrics	Metric to fetch. Supports calculated metrics.
dimensions	Dimensions to fetch.
dim_filters	A <a href="#">filter_clause_ga4</a> wrapping <a href="#">dim_filter</a>

met_filters	A <a href="#">filter_clause_ga4</a> wrapping <a href="#">met_filter</a>
filtersExpression	A v3 API style simple filter string. Not used with other filters.
order	An <a href="#">order_type</a> object
segments	List of segments as created by <a href="#">segment_ga4</a>
pivots	Pivots of the data as created by <a href="#">pivot_ga4</a>
cohorts	Cohorts created by <a href="#">make_cohort_group</a>
pageToken	Where to start the data fetch
pageSize	How many rows to fetch. Max 100000 each batch.
samplingLevel	Sample level
metricFormat	If supplying calculated metrics, specify the metric type
histogramBuckets	For numeric dimensions such as hour, a list of buckets of data. See details in <a href="#">make_ga_4_req</a>

## Metrics

Metrics support calculated metrics like `ga:users / ga:sessions` if you supply them in a named vector.

You must supply the correct `'ga:'` prefix unlike normal metrics

You can mix calculated and normal metrics like so:

```
customMetric <- c(sessionPerVisitor = "ga:sessions / ga:visitors", "bounceRate",
```

You can also optionally supply a `metricFormat` parameter that must be the same length as the metrics. `metricFormat` can be: `METRIC_TYPE_UNSPECIFIED`, `INTEGER`, `FLOAT`, `CURRENCY`, `PERCENT`, `TIME`

All metrics are currently parsed to `as.numeric` when in R.

## Dimensions

Supply a character vector of dimensions, with or without `ga:` prefix.

Optionally for numeric dimension types such as `ga:hour`, `ga:browserVersion`, `ga:sessionsToTransaction`, etc. supply histogram buckets suitable for histogram plots.

If non-empty, we place dimension values into buckets after string to `int64`. Dimension values that are not the string representation of an integral value will be converted to zero. The bucket values have to be in increasing order. Each bucket is closed on the lower end, and open on the upper end. The "first" bucket includes all values less than the first boundary, the "last" bucket includes all values up to infinity. Dimension values that fall in a bucket get transformed to a new dimension value. For example, if one gives a list of "0, 1, 3, 4, 7", then we return the following buckets: -

- bucket #1: values < 0, dimension value "<0"
- bucket #2: values in [0,1), dimension value "0"
- bucket #3: values in [1,3), dimension value "1-2"
- bucket #4: values in [3,4), dimension value "3"
- bucket #5: values in [4,7), dimension value "4-6"
- bucket #6: values >= 7, dimension value "7+"

**See Also**

Other GAv4 fetch functions: [fetch\\_google\\_analytics\\_4\\_slow](#), [fetch\\_google\\_analytics\\_4](#), [google\\_analytics](#)

**Examples**

```
## Not run:
library(googleAnalyticsR)

## authenticate,
## or use the RStudio Addin "Google API Auth" with analytics scopes set
ga_auth()

## get your accounts
account_list <- google_analytics_account_list()

## pick a profile with data to query

ga_id <- account_list[23, 'viewId']

ga_req1 <- make_ga_4_req(ga_id,
                        date_range = c("2015-07-30", "2015-10-01"),
                        dimensions=c('source', 'medium'),
                        metrics = c('sessions'))

ga_req2 <- make_ga_4_req(ga_id,
                        date_range = c("2015-07-30", "2015-10-01"),
                        dimensions=c('source', 'medium'),
                        metrics = c('users'))

fetch_google_analytics_4(list(ga_req1, ga_req2))

## End(Not run)
```

---

meta

*Google Analytics API metadata*

---

**Description**

This is a local copy of the data provided by [google\\_analytics\\_meta](#)

**Usage**

```
meta
```

**Format**

A data frame with 476 rows and 15 variables

**Details**

Running your own call will be more up to date, but this is here in case.

It does not include the multi-channel or cohort variables.

**Source**

<https://developers.google.com/analytics/devguides/reporting/core/dimsmets>

---

met_filter	<i>Make a metric filter object</i>
------------	------------------------------------

---

**Description**

Make a metric filter object

**Usage**

```
met_filter(metric, operator = c("EQUAL", "LESS_THAN", "GREATER_THAN",  
  "IS_MISSING"), comparisonValue, not = FALSE)
```

**Arguments**

metric	metric name to filter on.
operator	How to match the dimension.
comparisonValue	What to match.
not	Logical NOT operator. Boolean.

**Value**

An object of class `met_fil_ga4` for use in `filter_clause_ga4`

**See Also**

Other filter functions: `dim_filter`, `filter_clause_ga4`

## Examples

```
## Not run:
library(googleAnalyticsR)

## authenticate,
## or use the RStudio Addin "Google API Auth" with analytics scopes set
ga_auth()

## get your accounts
account_list <- google_analytics_account_list()

## pick a profile with data to query

ga_id <- account_list[23,'viewId']

## create filters on metrics
mf <- met_filter("bounces", "GREATER_THAN", 0)
mf2 <- met_filter("sessions", "GREATER", 2)

## create filters on dimensions
df <- dim_filter("source", "BEGINS_WITH", "1", not = TRUE)
df2 <- dim_filter("source", "BEGINS_WITH", "a", not = TRUE)

## construct filter objects
fc2 <- filter_clause_ga4(list(df, df2), operator = "AND")
fc <- filter_clause_ga4(list(mf, mf2), operator = "AND")

## make v4 request
ga_data1 <- google_analytics_4(ga_id,
                              date_range = c("2015-07-30", "2015-10-01"),
                              dimensions=c('source', 'medium'),
                              metrics = c('sessions', 'bounces'),
                              met_filters = fc,
                              dim_filters = fc2,
                              filtersExpression = "ga:source!=(direct)")

## End(Not run)
```

---

multi\_select

*multi\_select [Shiny Module]*

---

## Description

Shiny Module for use with [multi\\_selectUI](#)

**Usage**

```
multi_select(input, output, session, type = c("METRIC", "DIMENSION"),
             subType = c("all", "segment", "cohort"), default = NULL)
```

**Arguments**

input	shiny input
output	shiny output
session	shiny session
type	metric or dimension
subType	Limit selections to those relevant
default	The default selected choice. First element if NULL

**Details**

Call via `shiny::callModule(multi_select, "your_id")`

**Value**

the selected variable

**See Also**

Other Shiny modules: [authDropdownUI](#), [authDropdown](#), [multi\\_selectUI](#)

---

multi_selectUI	<i>multi_select UI [Shiny Module]</i>
----------------	---------------------------------------

---

**Description**

Shiny Module for use with [multi\\_select](#)

**Usage**

```
multi_selectUI(id, label = "Metric", multiple = TRUE, width = NULL)
```

**Arguments**

id	Shiny id
label	label
multiple	multiple select
width	width of select

**Details**

Create a Google Analytics variable selector

**Value**

Shiny UI

**See Also**

Other Shiny modules: [authDropdownUI](#), [authDropdown](#), [multi\\_select](#)

---

order_type	<i>Make an OrderType object</i>
------------	---------------------------------

---

**Description**

Make an OrderType object

**Usage**

```
order_type(field, sort_order = c("ASCENDING", "DESCENDING"),
  orderType = c("VALUE", "DELTA", "SMART", "HISTOGRAM_BUCKET",
    "DIMENSION_AS_INTEGER"))
```

**Arguments**

field	One field to sort by
sort_order	ASCENDING or DESCENDING
orderType	Type of ordering

**Details**

For multiple order sorting, create separate OrderType objects to pass

**Value**

A order\_type\_ga4 object for use in GAv4 fetch

---

pivot_ga4	<i>Make a pivot object</i>
-----------	----------------------------

---

**Description**

Make a pivot object

**Usage**

```
pivot_ga4(pivot_dim, metrics, dim_filter_clause = NULL, startGroup = 0,  
          maxGroupCount = 5)
```

**Arguments**

pivot_dim	A character vector of dimensions
metrics	Metrics to aggregate and return.
dim_filter_clause	Only data included in filter included.
startGroup	which groups of k columns are included in response (0 indexed).
maxGroupCount	Maximum number of groups to return.

**Details**

If maxGroupCount is set to -1 returns all groups.

**Value**

pivot object of class pivot\_ga4 for use in [filter\\_clause\\_ga4](#)

**Examples**

```
## Not run:  
library(googleAnalyticsR)  
  
## authenticate,  
## or use the RStudio Addin "Google API Auth" with analytics scopes set  
ga_auth()  
  
## get your accounts  
account_list <- google_analytics_account_list()  
  
## pick a profile with data to query  
  
ga_id <- account_list[23, 'viewId']  
  
## filter pivot results to  
pivot_dim_filter1 <- dim_filter("medium",
```

```
      "REGEXP",
      "organic|social|email|cpc")

pivot_dim_clause <- filter_clause_ga4(list(pivot_dim_filter1))

pivme <- pivot_ga4("medium",
  metrics = c("sessions"),
  maxGroupCount = 4,
  dim_filter_clause = pivot_dim_clause)

pivtest <- google_analytics(ga_id,
  c("2016-01-30", "2016-10-01"),
  dimensions=c('source'),
  metrics = c('sessions'),
  pivots = list(pivme))

## End(Not run)
```

---

segmentBuilder

*Create a GAv4 Segment Builder*

---

## Description

Shiny Module for use with [segmentBuilderUI](#)

## Usage

```
segmentBuilder(input, output, session)
```

## Arguments

input	shiny input
output	shiny output
session	shiny session

## Details

Call via `shiny::callModule(segmentBuilder, "your_id")`

## Value

A segment definition

## Examples

```
## Not run:

library(shiny)
library(googleAnalyticsR)

ui <- shinyUI(fluidPage(
  segmentBuilderUI("test1")
))

server <- shinyServer(function(input, output, session) {

  segment <- callModule(segmentBuilder, "test1")

  .. use segment() in further gav4 calls.

})

# Run the application
shinyApp(ui = ui, server = server)

## End(Not run)
```

---

segmentBuilderUI	<i>Create a GAv4 Segment Builder</i>
------------------	--------------------------------------

---

## Description

Shiny Module for use with [segmentBuilder](#)

## Usage

```
segmentBuilderUI(id)
```

## Arguments

id	Shiny id
----	----------

## Value

Shiny UI for use in app

## Examples

```
## Not run:

library(shiny)
library(googleAnalyticsR)

ui <- shinyUI(fluidPage(
  segmentBuilderUI("test1")
))

server <- shinyServer(function(input, output, session) {

  segment <- callModule(segmentBuilder, "test1")

  .. use segment() in further gav4 calls.

})

# Run the application
shinyApp(ui = ui, server = server)

## End(Not run)
```

---

segment\_define

*Make a segment definition*

---

## Description

Defines the segment to be a set of SegmentFilters which are combined together with a logical AND operation.

segment\_define is in the hierarchy of segment creation, for which you will also need:

- [segment\\_define](#) : AND combination of segmentFilters
- [segment\\_vector\\_simple](#) or [segment\\_vector\\_sequence](#)
- [segment\\_element](#) that are combined in OR lists for segment\_vectors\_\*

## Usage

```
segment_define(segment_filters, not_vector = NULL)
```

## Arguments

segment\_filters

A list of [segment\\_vector\\_simple](#) and [segment\\_vector\\_sequence](#)

not\_vector

Boolean applied to each segmentFilter step. If NULL, assumed FALSE

**Value**

segmentDefinition object for [segment\\_ga4](#)

**See Also**

Other v4 segment functions: [segment\\_element](#), [segment\\_ga4](#), [segment\\_vector\\_sequence](#), [segment\\_vector\\_simple](#)

---

segment_element	<i>Make a segment element</i>
-----------------	-------------------------------

---

**Description**

segment\_element is the lowest hierarchy of segment creation, for which you will also need:

- [segment\\_define](#) : AND combination of segmentFilters
- [segment\\_vector\\_simple](#) or [segment\\_vector\\_sequence](#)
- [segment\\_element](#) that are combined in OR lists for segment\_vectors\_\*

**Usage**

```
segment_element(name, operator = c("REGEXP", "BEGINS_WITH", "ENDS_WITH",
  "PARTIAL", "EXACT", "IN_LIST", "NUMERIC_LESS_THAN", "NUMERIC_GREATER_THAN",
  "NUMERIC_BETWEEN", "LESS_THAN", "GREATER_THAN", "EQUAL", "BETWEEN"),
  type = c("METRIC", "DIMENSION"), not = FALSE, expressions = NULL,
  caseSensitive = NULL, minComparisonValue = NULL,
  maxComparisonValue = NULL, scope = c("SESSION", "USER", "HIT", "PRODUCT"),
  comparisonValue = NULL, matchType = c("PRECEDES", "IMMEDIATELY_PRECEDES"))
```

**Arguments**

name	Name of the GA metric or dimension to segment on
operator	How name shall operate on expression or comparisonValue
type	A metric or dimension based segment element
not	Should the element be the negation of what is defined
expressions	[dim] What the name shall compare to
caseSensitive	[dim] Whether to be case sensitive
minComparisonValue	[dim] Minimum comparison values for BETWEEN
maxComparisonValue	Max comparison value for BETWEEN operator
scope	[met] Scope of the metric value
comparisonValue	[met] What the name shall compare to
matchType	If used in sequence segment, what behaviour

**Value**

An SegmentFilterClause object

**See Also**

Other v4 segment functions: [segment\\_define](#), [segment\\_ga4](#), [segment\\_vector\\_sequence](#), [segment\\_vector\\_simple](#)

---

segment\_ga4

*Make a segment object for use*

---

**Description**

A Segment is a subset of the Analytics data. For example, of the entire set of users, one Segment might be users from a particular country or city.

**Usage**

```
segment_ga4(name, segment_id = NULL, user_segment = NULL,
            session_segment = NULL)
```

**Arguments**

name	The name of the segment for the reports.
segment_id	The segment ID of a built in or custom segment e.g. gaid::-3
user_segment	A list of segment_define's that apply to users
session_segment	A list of segment_define's that apply to sessions

**Details**

segment\_ga4 is the top hierarchy of segment creation, for which you will also need:

- [segment\\_define](#) : AND combination of segmentFilters
- [segment\\_vector\\_simple](#) or [segment\\_vector\\_sequence](#)
- [segment\\_element](#) that are combined in OR lists for segment\_vectors\_\*

**Value**

a segmentFilter object. You can pass a list of these to the request.

**See Also**

Other v4 segment functions: [segment\\_define](#), [segment\\_element](#), [segment\\_vector\\_sequence](#), [segment\\_vector\\_simple](#)

## Examples

```
## Not run:
library(googleAnalyticsR)

## authenticate,
## or use the RStudio Addin "Google API Auth" with analytics scopes set
ga_auth()

## get your accounts
account_list <- google_analytics_account_list()

## pick a profile with data to query

ga_id <- account_list[23,'viewId']

## make a segment element
se <- segment_element("sessions",
                      operator = "GREATER_THAN",
                      type = "METRIC",
                      comparisonValue = 1,
                      scope = "USER")

se2 <- segment_element("medium",
                      operator = "EXACT",
                      type = "DIMENSION",
                      expressions = "organic")

## choose between segment_vector_simple or segment_vector_sequence
## Elements can be combined into clauses, which can then be
## combined into OR filter clauses
sv_simple <- segment_vector_simple(list(list(se)))

sv_simple2 <- segment_vector_simple(list(list(se2)))

## Each segment vector can then be combined into a logical AND

seg_defined <- segment_define(list(sv_simple, sv_simple2))

## if only one AND definition, you can leave out wrapper list()

seg_defined_one <- segment_define(sv_simple)

## Each segment definition can apply to users, sessions or both.
## You can pass a list of several segments

segment4 <- segment_ga4("simple", user_segment = seg_defined)
## Add the segments to the segments param
```

```
segment_example <- google_analytics(ga_id,
                                     c("2015-07-30", "2015-10-01"),
                                     dimensions=c('source', 'medium', 'segment'),
                                     segments = segment4,
                                     metrics = c('sessions', 'bounces')
                                     )

## Sequence segment

se2 <- segment_element("medium",
                      operator = "EXACT",
                      type = "DIMENSION",
                      expressions = "organic")

se3 <- segment_element("medium",
                      operator = "EXACT",
                      type = "DIMENSION",
                      not = TRUE,
                      expressions = "organic")

## step sequence
## users who arrived via organic then via referral
sv_sequence <- segment_vector_sequence(list(list(se2),
                                             list(se3)))

seq_defined2 <- segment_define(list(sv_sequence))

segment4_seq <- segment_ga4("sequence", user_segment = seq_defined2)

## Add the segments to the segments param

segment_seq_example <- google_analytics(ga_id,
                                         c("2016-04-01", "2016-05-01"),
                                         dimensions=c('source', 'segment'),
                                         segments = segment4_seq,
                                         metrics = c('sessions', 'bounces')
                                         )

## End(Not run)
```

---

segment\_vector\_sequence

*Make sequenceSegment*

---

### **Description**

segment\_vector\_sequence is in the hierarchy of segment creation, for which you will also need:

- [segment\\_define](#) : AND combination of segmentFilters
- [segment\\_vector\\_simple](#) or [segment\\_vector\\_sequence](#)
- [segment\\_element](#) that are combined in OR lists for segment\_vectors\_\*

### Usage

```
segment_vector_sequence(segment_elements, firstStepMatch = FALSE)
```

### Arguments

segment\_elements  
a list of OR lists of segment elements

firstStepMatch FALSE default

### See Also

Other v4 segment functions: [segment\\_define](#), [segment\\_element](#), [segment\\_ga4](#), [segment\\_vector\\_simple](#)

segment\_vector\_simple *Make a simple segment vector*

### Description

segment\_vector\_simple is in the hierarchy of segment creation, for which you will also need:

- [segment\\_define](#) : AND combination of segmentFilters
- [segment\\_vector\\_simple](#) or [segment\\_vector\\_sequence](#)
- [segment\\_element](#) that are combined in OR lists for segment\_vectors\_\*

### Usage

```
segment_vector_simple(segment_elements)
```

### Arguments

segment\_elements  
A list of OR lists of [segment\\_element](#)

### Value

A segment vector you can put in a list for use in [segment\\_ga4](#)

### See Also

Other v4 segment functions: [segment\\_define](#), [segment\\_element](#), [segment\\_ga4](#), [segment\\_vector\\_sequence](#)
