Package 'rworldxtra'

October 14, 2022

Type Package

Title Country boundaries at high resolution.

Version 1.01

Date 2012-10-3

Author Andy South

Maintainer Andy South <southandy@gmail.com>

Description High resolution vector country boundaries derived from Natural Earth data, can be plotted in rworldmap.

License GPL (>= 2)

R topics documented:

`rworldxtra-package` *For mapping global data.*

Description

Enables mapping of country level and gridded user datasets by facilitating joining to world maps and visualisation options.

Examples

```
data(countriesHigh)
```

`countriesHigh` *a high resolution world map, a vector map of 253 country boundaries*

Description

A 'SpatialPolygonsDataFrame' [package "sp"] object containing country boundaries derived from Natural Earth data. Polygons are attributed with country codes.

Usage

```
data(countriesHigh)
```

Details

Derived fron version 1.4.0 of Natural Earth data 1:10 m data.

The different country boundaries in rworldmap are processed from Natural Earth Data as follows : All : ~ rename any non-ASCII country names that cause R trouble ~ rename Curacao which is particularly troublesome ! ~ check polygon geometries using checkPolygonsHoles ~ set projections, e.g. proj4string(countriesCoarse) <- CRS("+proj=longlat +ellps=WGS84 +datum=WGS84 +no_defs") ~ set polygon IDs to country names (from ADMIN field) ~ copy ISO_A3 to ISO3 ~ replace missing ISO3 codes (6 in this version) with ADM0_A3 ~ check for duplicate ISO3 codes (2 in this version) ~ set ISO3 for Gaza to Gaza and 'Ashmore and Cartier Islands' to Ashm ~ replace POP_EST of -99 with NA ~ join on countryRegions data
